Chapter 3.4.8 - Web Service User Transactions

Read Key Information

This transaction is used to read the key in the specified Cencon keybox and return key information such as key serial number.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), and an information record about the key.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Key Data:

KeyInformation

This record contains generic data read from the key.

CanType

This is the can type of the key. This is a single byte value indicating the hardware model of the key. See below for possible values.

KeyID

This is the 6 byte key ID for the key in the key reader. The combination of the key ID and the can type is a unique value.

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/read_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/read_key
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_READ_KEY>
  <IPAddress>10.108.6.108:53003</IPAddress>
  <CommunicationsID/>
```

```

    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID/>
  </TRANSACTION_READ_KEY>

```

Example Output Transaction:

```

<RESPONSE_READ_KEY>
  <TRANSACTION_READ_KEY>
    <IPAddress>10.108.6.108:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_KEY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>The key read information succeeded.</Description>
  </ResultRecord>
  <KeyInformation>
    <KeyID>0000003D6C33</KeyID>
    <CanType>18</CanType>
  </KeyInformation>
</RESPONSE_READ_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran key read transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the IPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example reads key information through a remote keybox agent persistent network connection:
KeyBoxSerialNumber:01E164991400008B

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/read_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/read_key
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "IPAddressField" : null
}

```

Example Output Transaction - JSON:

```
{

    "resultField" : 0
  } ,
  "tTRANSACTION_READ_KEYField" :
  {
    "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
    "communicationsMethodField" : 1 ,
    "dispatcherIDField" : "CentranSS" ,
    "iAddressField" : null
  }
}
```

3.4.9 Web Service User Transactions - Read User Key

CenTran Programming Reference Manual

This transaction is used to read the key in the specified Cencon keybox and return the matching user data from the Cencon database.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), the retrieved user record, and an array of user key audits read from the user key.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- No user is assigned to the key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

User Key Audit Data:

- Event Type - This is the text description of the type of event.
- Lock Mode - This is an identifier for the lock mode involved in the event. This will be F, R, B, or empty.
- Serial Number - This is the serial number for the lock involved in the event.
- Lock Name - This is the lock name matching the lock serial number, as looked up from the Cencon database.
- Event Date - This is the date / time of the event in UTC based time.
- Lock Open Time - This is the date / time of the lock open event in UTC based time. This will be empty of not applicable to the event.
- Lock Close Time - This is the date / time of the lock close event in UTC based time. This will be empty of not applicable to the event.
- Lock Close Seal Count - This is the close seal count for the lock mode being closed. This will be empty of not applicable to the event.
- Lock Close Seal - This is the close seal for the lock mode being closed. This will be empty of not applicable to the event.
- Is Duplicate Close Seal - This flag indicates that the close seal is from a #4 operation at the lock to get the last close seal. This is used when the lock close seal was not retrieved by the person to last open the lock.
- Is Key Audit Record CRC Invalid - This flag indicates that the CRC (Cyclic Redundancy Check) value was not correct. This means the audit data could be corrupted or the audit trail on the key has been tampered with.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/read_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/read_key
```

</UserKeyAuditRecord>
</RESPONSE_READ_USER_KEY>

```

Example 2 - Failure: Unknown key

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/read_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/read_key
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_READ_USER_KEY>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_READ_USER_KEY>

```

Output Transaction:

In this example, the user key does not exist in the database.

```

<RESPONSE_READ_USER_KEY>
  <TRANSACTION_READ_USER_KEY>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_USER_NOT_FOUND</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>User key serial number being read was not found in database.</Description>
  </ResultRecord>
</RESPONSE_READ_USER_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user key read transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.

1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

Example

This example reads a user key through a remote keybox agent persistent network connection:
KeyBoxSerialNumber:01E164991400008B

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/read_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/read_key
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "The user key read succeeded."
    ] ,

3.4.10 Web Service User Transactions - Delete User

CenTran Programming Reference Manual

This transaction is used to delete a user from the Cencon database based on the user name.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- User ID - Uniquely identifies a user record to be deleted.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the deleted user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/delete
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_USER>
  <UserID>fbob</UserID>
  <DispatcherID/>
</TRANSACTION_DELETE_USER>
```

Example Output Transaction:

```
<RESPONSE_DELETE_USER>
  <TRANSACTION_DELETE_USER>
    <UserID>fbob</UserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_USER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>The user delete succeeded.</Description>
  </ResultRecord>
  <UserRecord>
    <UserID>fbob</UserID>
    <SecurityLevel>2</SecurityLevel>
    <KeyID>000000419428</KeyID>
    <CanType>04</CanType>
    <NumberCombosIssued>0</NumberCombosIssued>
    <CreationDate/>
    <DeletionDate>2012-08-28T18:06:06.276Z</DeletionDate>
    <Nickname>Bob Edw</Nickname>
    <NicknameExpirationDate>2003-03-28T08:55:44Z</NicknameExpirationDate>
    <GroupName/>
    <NumberTimeWindows>0</NumberTimeWindows>
    <Window1Start>0</Window1Start>
    <Window1Duration>0</Window1Duration>
    <IfWindow1Sun>>false</IfWindow1Sun>
    <IfWindow1Mon>>false</IfWindow1Mon>
    <IfWindow1Tue>>false</IfWindow1Tue>
    <IfWindow1Wed>>false</IfWindow1Wed>
    <IfWindow1Thu>>false</IfWindow1Thu>
    <IfWindow1Fri>>false</IfWindow1Fri>
    <IfWindow1Sat>>false</IfWindow1Sat>
    <Window2Start>0</Window2Start>
    <Window2Duration>0</Window2Duration>
    <IfWindow2Sun>>false</IfWindow2Sun>
```

```

<IfWindow2Mon>false</IfWindow2Mon>
<IfWindow2Tue>false</IfWindow2Tue>
<IfWindow2Wed>false</IfWindow2Wed>
<IfWindow2Thu>false</IfWindow2Thu>
<IfWindow2Fri>false</IfWindow2Fri>
<IfWindow2Sat>false</IfWindow2Sat>
<Window3Start>0</Window3Start>
<Window3Duration>0</Window3Duration>
<IfWindow3Sun>false</IfWindow3Sun>
<IfWindow3Mon>false</IfWindow3Mon>
<IfWindow3Tue>false</IfWindow3Tue>
<IfWindow3Wed>false</IfWindow3Wed>
<IfWindow3Thu>false</IfWindow3Thu>
<IfWindow3Fri>false</IfWindow3Fri>
<IfWindow3Sat>false</IfWindow3Sat>
<Region>KENTUCKY</Region>
<ServiceBranch/>
<FirstName/>
<MiddleName/>
<LastName/>
<LastUsedDate>2011-07-19T17:07:50.623Z</LastUsedDate>
<AuthorizationRole>Route</AuthorizationRole>
<BankUserID>0</BankUserID>
<TotalNumberCombosIssued>3</TotalNumberCombosIssued>
<MaximumNumberAllowedCombos>0</MaximumNumberAllowedCombos>
<EnabledStartDate/>
<EnabledEndDate/>
<BankBranchName/>
<CustomerID/>
<UserCombo>0</UserCombo>
<IfMustChangeCombo>true</IfMustChangeCombo>
<IfLegacyImport>false</IfLegacyImport>
</UserRecord>
</RESPONSE_DELETE_USER>

```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/delete
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_DELETE_USER>
  <UserID>CDD</UserID>
  <DispatcherID/>
</TRANSACTION_DELETE_USER>

```

Output Transaction:

In this example, user CDD that is being deleted is a dispatcher.

```

<RESPONSE_DELETE_USER>
  <TRANSACTION_DELETE_USER>
    <UserID>CDD</UserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_USER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>CenTran only supports deleting FLM, Route, and Bank mode lock users.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_USER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete user transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON**Input Transaction Format (HTTP Post) - JSON:**

```
https://{host}/CentranServiceJSON/rest/user/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/delete
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "userIDField" : "newrsp"
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "The user delete succeeded."
    ] ,
    "errorCodeField" : "RC_OK" ,

}
}

```

3.4.11 Web Service User Transactions - User Table Query

CenTran Programming Reference Manual

This transaction queries the user table for a set of user records. The query record in the input transaction file contains a set of user fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Users' form to search for users to be displayed in a user report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the user records in the user table are retrieved.

- User ID
- Nickname
- Group Name
- Key ID
- Array of user authorization roles (FLM, Supervisor etc)
- Combo Issued range (Combo Issued Minimum and Combo Issued Maximum)
- Has Time Window Set flag
- Has Group Name Access Check flag
- Creation Date range (Creation Date Start and Creation Date End)
- Deletion Date range (Deletion Date Start and Deletion Date End - applies to User History and User Archive Table search)
- Last Used Date range (Last Used Date Start and Last Used Date End)
- Enabled Start Date range (Enabled Start Date Start and Enabled Start Date End)
- Enabled End Date range (Enabled End Date Start and Enabled End Date End)
- Region Name
- Customer ID
- Service Branch
- First Name
- Middle Name
- Last Name
- Bank Branch Name
- Lock Serial Number - This specifies to search for users dispatched to a lock serial number.
- List Key Model - This specifies key models (can types) to search for.
- If Search Enabled Users - This specifies to return only enabled users.
- If Search Dispatches Exceeded - This specifies to return only users who have exceeded their permitted number of dispatches.
- If Has Time Window - This specifies to return only users who have a time window restriction defined.
- If Group Name Access Check - This specifies to do a comparison for group name access. Group based access restriction is no longer supported. This field is for backwards compatibility.
- Bank User ID - This specifies to search for a numeric bank user id.
- Bank Branch Name - This specifies to search for users assigned to the specified bank branch.
- If Legacy Import - This specifies to search for users that are a legacy import from an earlier version of the Cenbank software.
- If Search Exact Flag - This specifies that strings used in the search must be an exact match.
- If Post Fix Wild card Only - This specifies that approximate matches of strings are done against the start of the string.
- Dispatcher ID (Optional) - This is not part of the query record. If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: If the Dispatcher belongs to a local region and region control is enabled, only those users belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

Note: For the Creation Date Range, Deletion Date Range, Last Used Date Range and the Combo Issued Range, both the lower and upper bounds for the search have to be specified.

Note: If string fields such as Nickname or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for user records having an empty Nickname or Customer ID field. This applies to all the query transactions.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the user records (with the encrypted password fields left blank) matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open user table.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CenTranService/rest/user/query
```

Input Transaction: (HTTP Body)

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the user table for any users assigned to customer ID **Bank of the West**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.4.12 Web Service User Transactions - User Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the user table matching the given query condition. This transaction uses the same format as the User Table Query transaction. Note that you can search for any of the user database columns. The specified search items are "anded" together for the query.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_QUERY_COUNT>
  <UserQueryRecord>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- List of strings -->
    <ListAuthorizationRoles>
      <AuthorizationRole>FLM</AuthorizationRole>
      <AuthorizationRole>Bank</AuthorizationRole>
      <AuthorizationRole>Supervisor</AuthorizationRole>
    </ListAuthorizationRoles>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_QUERY_COUNT>
```

Output Transaction:

In this example, the output indicates that there are 4 FLM/Bank/Supervisor users in region TestRegionD.

```
<RESPONSE_USER_QUERY_COUNT>
  <TRANSACTION_USER_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <Region>TestRegionD</Region>
      <ListAuthorizationRoles>
        <AuthorizationRole>FLM</AuthorizationRole>
        <AuthorizationRole>Bank</AuthorizationRole>
        <AuthorizationRole>Supervisor</AuthorizationRole>
      </ListAuthorizationRoles>
    </UserQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of user records matching the given query: 4.
  </Description>
  </ResultRecord>
  <QueryCount>4</QueryCount>
</RESPONSE_USER_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user table query count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the user table for the count of users assigned to customer ID **Bank of the West**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/user/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```

}
}
}

```

3.4.13 Web Service User Transactions - User History Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query, but is applied against the User History Table.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user-history/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user-history/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_HISTORY_QUERY>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>Cust</CustomerID>
    <!-- char string -->
    <ServiceBranch>D</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2007-04-02T16:00:00</DeletionDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_HISTORY_QUERY>
```

Output Transaction:

Here, all records in the user history table which have Customer ID like 'Cust' (If Search Exact flag is set to false), Service Branch like 'D' (If Search Exact flag is set to false) and Deletion Date between 2005-03-01 15:00:00 and 2007-04-02 16:00:00 are retrieved. There are two records which match the search condition. The actual Customer ID in these two records is 'ACustomer' and the actual service branch in these two records is 'Dieb'.

```
<RESPONSE_USER_HISTORY_QUERY>
  <TRANSACTION_USER_HISTORY_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>Cust</CustomerID>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user history table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the user history table for deleted users assigned to bank branch name **North Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user-history/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user-history/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.4.14 Web Service User Transactions - User History Table Query Record Count

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query Record Count, but is applied against the User History Table.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user-history/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user-history/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_HISTORY_QUERY_COUNT>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>D</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2007-04-02T16:00:00</DeletionDateEnd>
    <!-- bool -->
    <IfSearchExact>1</IfSearchExact>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_HISTORY_QUERY_COUNT>
```

Output Transaction:

In this transaction, the Search Exact Flag has been set to true and there are no user history records with Service Branch equal to 'D'. Therefore the query count is 0.

```
<RESPONSE_USER_HISTORY_QUERY_COUNT>
  <TRANSACTION_USER_HISTORY_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>
      <ServiceBranch>D</ServiceBranch>
      <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
      <DeletionDateEnd>2007-04-02T16:00:00</DeletionDateEnd>
      <IfSearchExact>1</IfSearchExact>
    </UserQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_HISTORY_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of user history records matching the given query: 0.
    </Description>
  </ResultRecord>
  <QueryCount>0</QueryCount>
</RESPONSE_USER_HISTORY_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user history table query count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the user history table for the count of deleted users assigned to bank branch name **North Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user-history/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user-history/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "userQueryRecordField" :
  {
    "bankBranchNameField" : "North Bank Branch" ,
    "bankUserIDField" : null ,
    "combosIssuedMaximumField" : null ,
    "combosIssuedMinimumField" : null ,
    "creationDateEndField" : null ,
    "creationDateEndFieldSpecified" : false ,
    "creationDateStartField" : null ,
    "creationDateStartFieldSpecified" : false ,

3.4.15 Web Service User Transactions - User Archive Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query, but is applied against the User Archive Table.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user-archive/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user-archive/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_ARCHIVE_QUERY>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>Dieb</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2006-04-02T16:00:00</DeletionDateEnd>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_ARCHIVE_QUERY>
```

Output Transaction:

```
<RESPONSE_USER_ARCHIVE_QUERY>
  <TRANSACTION_USER_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>

    <Description>No user archive record found satisfying the search condition.
  </Description>
  </ResultRecord>
</RESPONSE_USER_ARCHIVE_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user archive table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the user archive table for deleted users named **testp2**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user-archive/query
```

3.4.16 Web Service User Transactions - User Archive Table Query Record Count

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query Record Count, but is applied against the User Archive Table.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user-archive/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user-archive/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_ARCHIVE_QUERY_COUNT>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>Dieb</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2006-04-02T16:00:00</DeletionDateEnd>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_ARCHIVE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_USER_ARCHIVE_QUERY_COUNT>
  <TRANSACTION_USER_ARCHIVE_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>
      <ServiceBranch>Dieb</ServiceBranch>
      <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
      <DeletionDateEnd>2006-04-02T16:00:00</DeletionDateEnd>
    </UserQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_ARCHIVE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of user archive records matching the given query: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_USER_ARCHIVE_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user archive table query count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the user archive table for the count of deleted users named **testp2**.

Input Transaction Format (HTTP Post) - JSON:

https://{host}/CentranServiceJSON/rest/user-archive/query-count

Example Input Transaction (HTTP Post) - JSON:

https://kml-3242.domain.local/CentranServiceJSON/rest/user-archive/query-count

Example Input Transaction (HTTP Body) - JSON:

3.5.1 Web Service Customer Transactions - Add Customer

CenTran Programming Reference Manual

This transaction adds a customer to the database.

Transaction information required:

- Customer ID
- Customer Number (Optional)
- Name (Optional)
- Address 1 (Optional)
- Address 2 (Optional)
- City (Optional)
- State (Optional)
- ZIP Code (Optional)
- Service Branch (Optional)
- Line Branch (Optional)
- Country (Optional)
- Telephone Number (Optional)
- FAX Number (Optional)
- Cell Phone Number (Optional)
- Point Of Contact Information (Optional)
- Email Information (Optional)
- Description (Optional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer already exists but the flag to allow overwrite is not set
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/add
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/add
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_ADD_CUSTOMER>
  <CustomerRecord>
    <CustomerID>3rd Eastern Regional Bank</CustomerID>
    <CustomerNumber>123322</CustomerNumber>
    <CustomerName>AG</CustomerName>
    <CustomerAddress1>810 Transcript Ave</CustomerAddress1>
    <CustomerAddress2>Suite #14</CustomerAddress2>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerState>KY</CustomerState>
    <CustomerZIP>40508</CustomerZIP>
    <ServiceBranch>Newton Pike</ServiceBranch>
    <LineBranch>Pike Newton</LineBranch>
    <CustomerCountry>US</CustomerCountry>
    <Telephone>(234) 123-4567</Telephone>
    <Fax>(234) 123-1234</Fax>
    <Cell>(123) 123-1234</Cell>
    <PointOfContact>Kaba Mas</PointOfContact>
    <Email>abc@kml.kaba.com</Email>
    <Description>Customer Example</Description>
  </CustomerRecord>
  <DispatcherID/>
</TRANSACTION_ADD_CUSTOMER>
```

Output Transaction:

The customer is added successfully to the customer table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_CUSTOMER) and a result record (indicating success).

```
<RESPONSE_ADD_CUSTOMER>
  <TRANSACTION_ADD_CUSTOMER>
    <CustomerRecord>
      <CustomerID>3rd Eastern Regional Bank</CustomerID>
      <CustomerNumber>123322</CustomerNumber>
      <CustomerName>AG</CustomerName>
```

```

        <CustomerAddress1>810 Transcript Ave</CustomerAddress1>
        <CustomerAddress2>Suite #14</CustomerAddress2>
        <CustomerCity>Lexington</CustomerCity>
        <CustomerState>KY</CustomerState>
        <CustomerZIP>40508</CustomerZIP>
        <ServiceBranch>Newton Pike</ServiceBranch>
        <LineBranch>Pike Newton</LineBranch>
        <CustomerCountry>US</CustomerCountry>
        <Telephone>(234) 123-4567</Telephone>
        <Fax>(234) 123-1234</Fax>
        <Cell>(123) 123-1234</Cell>
        <PointOfContact>Kaba Mas</PointOfContact>
        <Email>abc@kml.kaba.com</Email>
        <Description>Customer Example</Description>
    </CustomerRecord>
    <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_CUSTOMER>
<ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Customer 3rd Eastern Regional Bank successfully added to the database.
</Description>
</ResultRecord>
</RESPONSE_ADD_CUSTOMER>

```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/add
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/add
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_ADD_CUSTOMER>
  <CustomerRecord>
    <CustomerID>123456789</CustomerID>
    <CustomerNumber>777</CustomerNumber>
    <CustomerName>AG</CustomerName>
    <CustomerAddress1>888 Press Avenue</CustomerAddress1>
    <CustomerAddress2>Apt 121</CustomerAddress2>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerState>KY</CustomerState>
    <CustomerZIP>40508</CustomerZIP>
    <ServiceBranch>Newton Pike</ServiceBranch>
    <LineBranch>Pike Newton</LineBranch>
    <CustomerCountry>US</CustomerCountry>
    <Telephone>(234) 123-4567</Telephone>
    <Fax>(234) 123-1234</Fax>
    <Cell>(123) 123-1234</Cell>
    <PointOfContact>Mas Hamilton</PointOfContact>
    <Email>abc@kml.kaba.com</Email>
    <Description>Attempt at adding/updating customer record</Description>
  </CustomerRecord>
  <DispatcherID/>
</TRANSACTION_ADD_CUSTOMER>

```

Output Transaction:

In this example, Customer ID 123456789 already exists in the customer table but the overwrite flag is not set and therefore the transaction fails.

```

<RESPONSE_ADD_CUSTOMER>
  <TRANSACTION_ADD_CUSTOMER>
    <CustomerRecord>
      <CustomerID>123456789</CustomerID>
      <CustomerNumber>777</CustomerNumber>
      <CustomerName>AG</CustomerName>
      <CustomerAddress1>888 Press Avenue</CustomerAddress1>
      <CustomerAddress2>Apt 121</CustomerAddress2>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerState>KY</CustomerState>
      <CustomerZIP>40508</CustomerZIP>
      <ServiceBranch>Newton Pike</ServiceBranch>
      <LineBranch>Pike Newton</LineBranch>
      <CustomerCountry>US</CustomerCountry>
      <Telephone>(234) 123-4567</Telephone>
      <Fax>(234) 123-1234</Fax>
      <Cell>(123) 123-1234</Cell>
      <PointOfContact>Mas Hamilton</PointOfContact>
      <Email>abc@kml.kaba.com</Email>
      <Description>Attempt at adding/updating customer record</Description>
    </CustomerRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_CUSTOMER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_ADD_CUSTOMER_ALREADY_EXISTS</ErrorCode>

```

```

<IfRetryValid>false</IfRetryValid>
<Description>Customer 123456789 already exists.</Description>
</ResultRecord>
</RESPONSE_ADD_CUSTOMER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add customer transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example adds a customer named **My New Customer**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/customer/add
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/customer/add
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "customerRecordField" :
  {
    "cellField" : "859-253-4744" ,
    "customerAddress1Field" : "749 W. Short Street" ,

    } ,
    "dispatcherIDField" : "CentranSS"
}

```

3.5.2 Web Service Customer Transactions - Read Customer

CenTran Programming Reference Manual

This transaction reads a customer from the database.

Transaction information required:

- Customer ID

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the customer record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/customer/{customerid}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/customer/3rd Eastern Regional Bank/data
```

Output Transaction:

```
<RESPONSE_READ_CUSTOMER>
  <TRANSACTION_READ_CUSTOMER>
    <CustomerID>3rd Eastern Regional Bank</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_CUSTOMER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Success</Description>
  </ResultRecord>
  <CustomerRecord>
    <CustomerID>3rd Eastern Regional Bank</CustomerID>
    <CustomerNumber>123322</CustomerNumber>
    <CustomerName>AG</CustomerName>
    <CustomerAddress1>810 Transcript Ave</CustomerAddress1>
    <CustomerAddress2>Suite #14</CustomerAddress2>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerState>KY</CustomerState>
    <CustomerZIP>40508</CustomerZIP>
    <ServiceBranch>Newton Pike</ServiceBranch>
    <LineBranch>Pike Newton</LineBranch>
    <CustomerCountry>US</CustomerCountry>
    <Telephone>(234) 123-4567</Telephone>
    <Fax>(234) 123-1234</Fax>
    <Cell>(123) 123-1234</Cell>
    <PointOfContact>Kaba Mas</PointOfContact>
    <Email>abc@kml.kaba.com</Email>
    <Description>Customer Example</Description>
  </CustomerRecord>
</RESPONSE_READ_CUSTOMER>
```

Example 2 - Failure

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/customer/{customerid}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/customer/NoCustomer/data
```

Output Transaction:

Here, customer id **NoCustomer** does not exist in the Cencon database customer table.

```
<RESPONSE_READ_CUSTOMER>
  <TRANSACTION_READ_CUSTOMER>
    <CustomerID>NoCustomer</CustomerID>
```

```

    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_CUSTOMER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find the customer in the database customer table. The customer
    ID is not in the database customer table.</Description>
  </ResultRecord>
</RESPONSE_READ_CUSTOMER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read customer transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example reads the customer named **My New Customer** from the customer table. Note that spaces are encoded as **%20** in URLs.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/customer/{customerid}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/customer/My%20New%20Customer/data
```

Example Output Transaction - JSON:

```

{
  "customerRecordField" :
  {
    "cellField" : "859-253-4744" ,
    "customerAddress1Field" : "749 W. Short Street" ,
    "customerAddress2Field" : "" ,
    "customerCityField" : "Lexington" ,
    "customerCountryField" : "USA" ,
    "customerIDField" : "My New Customer" ,
    "customerNameField" : "New Customer LLC" ,
    "customerNumberField" : "123443" ,
    "customerStateField" : "KY" ,
    "customerZIPField" : "40507" ,
    "descriptionField" : "New Cencon Customer" ,
    "emailField" : "newcustomer@kml.kaba.com" ,
    "faxField" : "859-253-4748" ,
    "lineBranchField" : "North Bank Line Branch" ,
    "pointOfContactField" : "Fred at North Bank" ,
    "serviceBranchField" : "North Bank Service Branch" ,
    "telephoneField" : "859-253-4744"
  } ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Success"
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_READ_CUSTOMERField" :
  {
    "customerIDField" : "My New Customer" ,
    "dispatcherIDField" : "CentranSS"
  }
}

```

}

3.5.3 Web Service Customer Transactions - Update Customer

CenTran Programming Reference Manual

This transaction updates data for an existing customer in the database. The customer fields to be updated have to be specified in the input transaction. Those customer fields that are not specified in the input transaction will not be changed from their current values.

Transaction information required:

- Customer ID
- Customer Number (Optional) – The new value for this field
- Name (Optional) – The new value for this field
- Address 1 (Optional) – The new value for this field
- Address 2 (Optional) – The new value for this field
- City (Optional) – The new value for this field
- State (Optional) – The new value for this field
- ZIP Code (Optional) – The new value for this field
- Service Branch (Optional) – The new value for this field
- Line Branch (Optional) – The new value for this field
- Country (Optional) – The new value for this field
- Telephone Number (Optional) – The new value for this field
- FAX Number (Optional) – The new value for this field
- Cell Phone Number (Optional) – The new value for this field
- Point Of Contact Information (Optional) – The new value for this field
- Email Information (Optional) – The new value for this field
- Description (Optional) – The new value for this field

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated customer record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_CUSTOMER>
  <UpdateCustomerRecord>
    <CustomerCountry>USA</CustomerCountry>
    <CustomerZIP>40203</CustomerZIP>
    <CustomerState>KY</CustomerState>
    <CustomerCity>Louisville</CustomerCity>
    <CustomerAddress2>Suite #30</CustomerAddress2>
    <CustomerAddress1>809 Transcript Ave</CustomerAddress1>
    <CustomerNumber>123456</CustomerNumber>
    <CustomerID>123456789</CustomerID>
  </UpdateCustomerRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_CUSTOMER>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_CUSTOMER), a result record (indicating success) and the updated customer record with new Customer Number, Address 1, Address 2, City, State, ZIP, and Country values.

```
<RESPONSE_UPDATE_CUSTOMER>
  <TRANSACTION_UPDATE_CUSTOMER>
    <UpdateCustomerRecord>
      <CustomerCountry>USA</CustomerCountry>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the

enumerated value name. The following enumerated values are present in the CenTran update customer transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example updates the address for a customer named **My New Customer**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/customer/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/customer/update
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "updateCustomerRecordField" :
  {
    "cellField" : null ,
    "customerAddress1Field" : "207 Legends Ln" ,
    "customerAddress2Field" : null ,
    "customerCityField" : "Lexington" ,
    "customerCountryField" : "USA" ,
    "customerIDField" : "My New Customer" ,
    "customerNameField" : null ,
    "customerNumberField" : null ,
    "customerStateField" : "KY" ,
    "customerZIPField" : "40505" ,

        "telephoneField" : null  
    }  
}
```

3.5.4 Web Service Customer Transactions - Delete Customer

CenTran Programming Reference Manual

This transaction deletes a customer from the database.

Transaction information required:

- Customer ID

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer does not exist
- Customer is being referenced by one or more locks, users, route, or bank branch.
- Not authorized due to authorization role

Example 1 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_CUSTOMER>
  <CustomerID>NoCustomer</CustomerID>
  <DispatcherID/>
</TRANSACTION_DELETE_CUSTOMER>
```

Output Transaction:

```
<RESPONSE_DELETE_CUSTOMER>
  <TRANSACTION_DELETE_CUSTOMER>
    <CustomerID>NoCustomer</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_CUSTOMER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find customer NoCustomer in the customer table.</Description>
  </ResultRecord>
</RESPONSE_DELETE_CUSTOMER>
```

Example 2 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_CUSTOMER>
  <CustomerID>Yet Another Customer 3</CustomerID>
  <DispatcherID/>
</TRANSACTION_DELETE_CUSTOMER>
```

Output Transaction:

```
<RESPONSE_DELETE_CUSTOMER>
  <TRANSACTION_DELETE_CUSTOMER>
    <CustomerID>Yet Another Customer 3</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_CUSTOMER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
```

```

        <IfRetryValid>false</IfRetryValid>
        <Description>Customer Yet Another Customer 3 has been deleted successfully.
    </Description>
    </ResultRecord>
</RESPONSE_DELETE_CUSTOMER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran customer delete transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example deletes a customer named **My New Customer**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/customer/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/customer/delete
```

Example Input Transaction (HTTP Body) - JSON:

```

{
    "customerIDField" : "My New Customer" ,
    "dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "Customer My New Customer has been deleted successfully."
        ] ,
        "errorCodeField" : "RC_OK" ,
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "tTRANSACTION_DELETE_CUSTOMERField" :
    {
        "customerIDField" : "My New Customer" ,
        "dispatcherIDField" : "CentranSS"
    }
}

```

3.5.5 Web Service Customer Transactions - Query Customer Table

CenTran Programming Reference Manual

This transaction queries a customer table for a set of customer records. The query record in the input transaction file contains a set of customer fields to create a query from. The query record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Customers' form to search for customers to be displayed in a customer report.

Transaction information required:

- Customer ID (Optional)
- Search Exact flag for Customer ID (Optional)
- Customer Number (Optional)
- Name (Optional)
- Address 1 (Optional)
- Address 2 (Optional)
- City (Optional)
- State (Optional)
- ZIP Code (Optional)
- Service Branch (Optional)
- Line Branch (Optional)
- Country (Optional)
- Telephone Number (Optional)
- FAX Number (Optional)
- Cell Phone Number (Optional)
- Point Of Contact Information (Optional)
- Email Information (Optional)
- Description (Optional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note: If string fields such as Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for customer records in which Name or Customer ID field is empty).

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the customer records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error – failed to open customer table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_CUSTOMER_QUERY>
  <CustomerQueryRecord>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerName>AG</CustomerName>
  </CustomerQueryRecord>
  <DispatcherID/>
</TRANSACTION_CUSTOMER_QUERY>
```

Output Transaction:

By default, all fields except Customer Number are searched for values 'like' those given in the query record. For example, searching for Customer Name like 'Cust' will return all records whose Customer Name has 'Cust' as a substring. The search 'exact' option is available for the CustomerID field alone.

```
<RESPONSE_CUSTOMER_QUERY>
  <TRANSACTION_CUSTOMER_QUERY>
    <CustomerQueryRecord>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerName>AG</CustomerName>
    </CustomerQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CUSTOMER_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Number of customer records matching the given query: 3.</Description>
```

```

3.5.6 Web Service Customer Transactions - Query Customer Table Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the customer table matching the given query condition. This transaction uses the same format as the Customer Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/customer/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/customer/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_CUSTOMER_QUERY_COUNT>
  <CustomerQueryRecord>
    <CustomerZIP>40508</CustomerZIP>
  </CustomerQueryRecord>
  <DispatcherID/>
</TRANSACTION_CUSTOMER_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_CUSTOMER_QUERY_COUNT>
  <TRANSACTION_CUSTOMER_QUERY_COUNT>
    <CustomerQueryRecord>
      <CustomerZIP>40508</CustomerZIP>
    </CustomerQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CUSTOMER_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Number of customer records matching the given query: 8.</Description>
  </ResultRecord>
  <QueryCount>8</QueryCount>
</RESPONSE_CUSTOMER_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran customer table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the customer table for a count of customers with an address state of **KY**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/customer/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/customer/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "customerQueryRecordField" :
```

```

{
  "cellField" : null ,
  "customerAddress1Field" : null ,
  "customerAddress2Field" : null ,
  "customerCityField" : null ,
  "customerCountryField" : null ,
  "customerIDField" : null ,
  "customerNameField" : null ,
  "customerNumberField" : null ,
  "customerStateField" : "KY" ,
  "customerZIPField" : null ,
  "descriptionField" : null ,
  "emailField" : null ,
  "faxField" : null ,
  "ifExactCustomerIDField" : false ,
  "ifExactCustomerIDFieldSpecified" : false ,
  "lineBranchField" : null ,
  "pointOfContactField" : null ,
  "serviceBranchField" : null ,
  "telephoneField" : null
} ,
"dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
  "queryCountField" : "488" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of customer records matching the given query: 488."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_CUSTOMER_QUERY_COUNTField" :
  {
    "customerQueryRecordField" :
    {
      "cellField" : null ,
      "customerAddress1Field" : null ,
      "customerAddress2Field" : null ,
      "customerCityField" : null ,
      "customerCountryField" : null ,
      "customerIDField" : null ,
      "customerNameField" : null ,
      "customerNumberField" : null ,
      "customerStateField" : "KY" ,
      "customerZIPField" : null ,
      "descriptionField" : null ,
      "emailField" : null ,
      "faxField" : null ,

      "telephoneField" : null
    } ,
    "dispatcherIDField" : "CentranSS"
  }
}

```

3.6.1 Web Service Bank Branch Transactions - Add Bank Branch

CenTran Programming Reference Manual

This transaction adds a bank branch to the database.

Transaction information required:

- Bank Branch Name (64 character string)
- Bank Branch ID (1-9999 for Gen 1, 1-2 Billion for Gen 2)
- Customer ID (64 character string that must match an existing customer.)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid bank branch name
- Bank branch name already exists
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/bank-branch/add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/add
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ADD_BANK_BRANCH>
  <BankBranchRecord>
    <BankBranchName>North West Bank Branch</BankBranchName>
    <BankBranchID>2233</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
  <DispatcherID/>
</TRANSACTION_ADD_BANK_BRANCH>
```

Output Transaction:

The bank branch is added successfully to the bank branch table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_BANK_BRANCH) and a result record (indicating success).

```
<RESPONSE_ADD_BANK_BRANCH>
  <TRANSACTION_ADD_BANK_BRANCH>
    <BankBranchRecord>
      <BankBranchName>North West Bank Branch</BankBranchName>
      <BankBranchID>2233</BankBranchID>
      <CustomerID>North Bank</CustomerID>
    </BankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>BankBranch North West Bank Branch successfully added to the database.
  </Description>
  </ResultRecord>
</RESPONSE_ADD_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/bank-branch/add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/add
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ADD_BANK_BRANCH>
  <BankBranchRecord>
```

```

    <BankBranchName>North East Bank Branch</BankBranchName>
    <BankBranchID>2233</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
  <DispatcherID>
</TRANSACTION_ADD_BANK_BRANCH>

```

Output Transaction:

In this example, bank branch name **North East Bank Branch** already exists in the bank branch table.

```

<RESPONSE_ADD_BANK_BRANCH>
  <TRANSACTION_ADD_BANK_BRANCH>
    <BankBranchRecord>
      <BankBranchName>North East Bank Branch</BankBranchName>
      <BankBranchID>2233</BankBranchID>
      <CustomerID>North Bank</CustomerID>
    </BankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ADD_BANK_BRANCH_ALREADY_EXISTS</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Bank Branch North East Bank Branch already exists.</Description>
  </ResultRecord>
</RESPONSE_ADD_BANK_BRANCH>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add bank branch transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example adds a bank branch named **My New Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/add
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/add
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "bankBranchRecordField" :
  {
    "bankBranchIDField" : "98543232" ,
    "bankBranchNameField" : "My New Bank Branch" ,
    "customerIDField" : "My New Customer"
  } ,
  "dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "BankBranch My New Bank Branch successfully added to the database."
    ] ,
    "errorCodeField" : "RC_OK" ,

```

```
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "tTRANSACTION_ADD_BANK_BRANCHField" :
    {
        "bankBranchRecordField" :
        {
            "bankBranchIDField" : "98543232" ,
            "bankBranchNameField" : "My New Bank Branch" ,
            "customerIDField" : "My New Customer"
        } ,
        "dispatcherIDField" : "CentranSS"
    }
}
```

3.6.2 Web Service Bank Branch Transactions - Read Bank Branch

CenTran Programming Reference Manual

This transaction reads a bank branch from the database.

Transaction information required:

- Bank Branch Name (64 character string)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the bank branch record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Bank Branch does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/bank-branch/{bankbranchname}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/North Bank Branch/data
```

Output Transaction:

```
<RESPONSE_READ_BANK_BRANCH>
  <TRANSACTION_READ_BANK_BRANCH>
    <BankBranchName>North Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Success</Description>
  </ResultRecord>
  <BankBranchRecord>
    <BankBranchName>North Bank Branch</BankBranchName>
    <BankBranchID>1234</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
</RESPONSE_READ_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/bank-branch/{bankbranchname}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/WayOutBankBranch/data
```

Output Transaction:

Here, bank branch **WayOutBankBranch** does not exist in the Cencon database bank branch table.

```
<RESPONSE_READ_BANK_BRANCH>
  <TRANSACTION_READ_BANK_BRANCH>
    <BankBranchName>WayOutBankBranch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_BANK_BRANCH_NOT_FOUND</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Failed to find the bank branch in the database bank branch table. The
bank branch name is not in the database bank branch table.</Description>
  </ResultRecord>
</RESPONSE_READ_BANK_BRANCH>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read bank branch transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example reads the bank branch named **My New Bank Branch** from the bank branch table. Note that spaces are encoded as **%20** in URLs.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/{bankbranchname}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/My%20New%20Bank%20Branch/data
```

Example Output Transaction - JSON:

```
{
  "bankBranchRecordField" :
  {
    "bankBranchIDField" : "98543232" ,
    "bankBranchNameField" : "My New Bank Branch" ,
    "customerIDField" : "My New Customer"
  } ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Success"
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "TRANSACTION_READ_BANK_BRANCHField" :
  {
    "bankBranchNameField" : "My New Bank Branch" ,
    "dispatcherIDField" : "CentranSS"
  }
}
```

3.6.3 Web Service Bank Branch Transactions - Update Bank Branch

CenTran Programming Reference Manual

This transaction updates data for an existing bank branch in the database. The bank branch fields to be updated have to be specified in the input transaction. Those bank branch fields that are not specified in the input transaction will not be changed from their current values. The numeric bank branch ID can not be changed because it is written as part of the security data to bank mode locks.

Transaction information required:

- Bank Branch Name
- Customer ID (Optional) - The new value for this field

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated bank branch record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Bank Branch Name
- Bank Branch does not exist
- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_BANK_BRANCH>
  <UpdateBankBranchRecord>
    <CustomerID>Eastern Bank</CustomerID>
    <BankBranchName>North East Bank Branch</BankBranchName>
  </UpdateBankBranchRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_BANK_BRANCH>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_BANK_BRANCH), a result record (indicating success) and the updated bank branch record with new Customer ID value.

```
<RESPONSE_UPDATE_BANK_BRANCH>
  <TRANSACTION_UPDATE_BANK_BRANCH>
    <UpdateBankBranchRecord>
      <CustomerID>Eastern Bank</CustomerID>
      <BankBranchName>North East Bank Branch</BankBranchName>
    </UpdateBankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Bank Branch North East Bank Branch has been updated successfully.
  </ResultRecord>
  <BankBranchRecord>
    <BankBranchName>North East Bank Branch</BankBranchName>
    <BankBranchID>1235</BankBranchID>
    <CustomerID>Eastern Bank</CustomerID>
  </BankBranchRecord>
</RESPONSE_UPDATE_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_BANK_BRANCH>
  <UpdateBankBranchRecord>
    <CustomerID>Some Unknown Customer</CustomerID>
    <BankBranchName>North East Bank Branch</BankBranchName>
  </UpdateBankBranchRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_BANK_BRANCH>
```

Output Transaction:

The transaction fails because the Customer ID **Some Unknown Customer** does not exist in the Cencon database customer table.

```
<RESPONSE_UPDATE_BANK_BRANCH>
  <TRANSACTION_UPDATE_BANK_BRANCH>
    <UpdateBankBranchRecord>
      <CustomerID>Some Unknown Customer</CustomerID>
      <BankBranchName>North East Bank Branch</BankBranchName>
    </UpdateBankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>New customer Some Unknown Customer does not exist in the customer table.
  </Description>
</ResultRecord>
</RESPONSE_UPDATE_BANK_BRANCH>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran update bank branch transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example adds a bank branch named **My New Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/update
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "updateBankBranchRecordField" :
  {
    "bankBranchNameField" : "My New Bank Branch" ,
    "customerIDField" : "Eastern Bank"
  }
}
```

Example Output Transaction - JSON:

```
{
  "bankBranchRecordField" :
  {
    "bankBranchIDField" : "98543232" ,
    "bankBranchNameField" : "My New Bank Branch" ,
```

```

        "customerIDField" : "Eastern Bank"
    } ,
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "Bank Branch My New Bank Branch has been updated successfully."
        ] ,
        "errorCodeField" : "RC_OK" ,
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "tTRANSACTION_UPDATE_BANK_BRANCHField" :
    {
        "dispatcherIDField" : "CentranSS" ,
        "updateBankBranchRecordField" :
        {
            "bankBranchNameField" : "My New Bank Branch" ,
            "customerIDField" : "Eastern Bank"
        }
    }
}

```

3.6.4 Web Service Bank Branch Transactions - Delete Bank Branch

CenTran Programming Reference Manual

This transaction deletes a bank branch from the database.

Transaction information required:

- Bank Branch Name

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid bank branch name
- Bank branch does not exist
- Bank branch is still in use
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_BANK_BRANCH>
  <BankBranchName>North North West Bank Branch</BankBranchName>
  <DispatcherID/>
</TRANSACTION_DELETE_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_DELETE_BANK_BRANCH>
  <TRANSACTION_DELETE_BANK_BRANCH>
    <BankBranchName>North North West Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Bank Branch North North West Bank Branch has been deleted successfully.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_BANK_BRANCH>
  <BankBranchName>Some Unknown Bank Branch</BankBranchName>
  <DispatcherID/>
</TRANSACTION_DELETE_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_DELETE_BANK_BRANCH>
  <TRANSACTION_DELETE_BANK_BRANCH>
    <BankBranchName>Some Unknown Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_BANK_BRANCH_NOT_FOUND</ErrorCode>
```

```

<IfRetryValid>false</IfRetryValid>
<Description>Failed to find bank branch Some Unknown Bank Branch in the bank branch
table.</Description>
</ResultRecord>
</RESPONSE_DELETE_BANK_BRANCH>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran bank branch delete transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example deletes a bank branch named **My New Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/delete
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "bankBranchNameField" : "My New Bank Branch" ,
  "dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Bank Branch My New Bank Branch has been deleted successfully."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_DELETE_BANK_BRANCHField" :
  {
    "bankBranchNameField" : "My New Bank Branch" ,
    "dispatcherIDField" : "CentranSS"
  }
}

```

3.6.5 Web Service Bank Branch Transactions - Query Bank Branch Table

CenTran Programming Reference Manual

This transaction queries a bank branch table for a set of bank branch records. The query record in the input transaction file contains a set of bank branch fields to create a query from. The query record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Bank Branches' form to search for bank branches to be displayed in a bank branch report.

Transaction information required:

- Bank Branch Name
- Bank Branch ID minimum value (0-9999 for Gen 1, 0-2 Billion for Gen 2)
- Bank Branch ID maximum value (0-9999 for Gen 1, 0-2 Billion for Gen 2)
- Customer ID
- Search Exact flag

Note: If string fields such as Bank Branch Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for bank branch records in which Bank Branch Name or Customer ID field is empty).

Transaction information returned:

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the bank branch records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error – failed to open bank branch table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_BANK_BRANCH_QUERY>
  <BankBranchQueryRecord>
    <BankBranchIDMaximum>2900</BankBranchIDMaximum>
    <BankBranchIDMinimum>2800</BankBranchIDMinimum>
  </BankBranchQueryRecord>
  <DispatcherID/>
</TRANSACTION_BANK_BRANCH_QUERY>
```

Output Transaction:

By default, all fields except Customer Number are searched for values 'like' those given in the query record. For example, searching for Customer Name like 'Cust' will return all records whose Customer Name has 'Cust' as a substring. The search 'exact' option is available for the CustomerID field alone.

```
<RESPONSE_BANK_BRANCH_QUERY>
  <TRANSACTION_BANK_BRANCH_QUERY>
    <BankBranchQueryRecord>
      <BankBranchIDMaximum>2900</BankBranchIDMaximum>
      <BankBranchIDMinimum>2800</BankBranchIDMinimum>
    </BankBranchQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_BANK_BRANCH_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Number of bank branch records matching the given query: 4.</Description>
  </ResultRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2804)</BankBranchName>
    <BankBranchID>2804</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2813)</BankBranchName>
    <BankBranchID>2813</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
```

```

    <BankBranchName>Bank of the West (2857)</BankBranchName>
    <BankBranchID>2857</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2858)</BankBranchName>
    <BankBranchID>2858</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
</RESPONSE_BANK_BRANCH_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran bank branch table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the bank branch table for bank branches assigned to customer **Eastern Bank**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/query
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "bankBranchQueryRecordField" :
  {
    "bankBranchIDMaximumField" : null ,
    "bankBranchIDMinimumField" : null ,
    "bankBranchNameField" : null ,
    "customerIDField" : "Eastern Bank" ,
    "ifSearchExactField" : false ,
    "ifSearchExactFieldSpecified" : false
  } ,
  "dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
  "bankBranchRecordField" :
  [
    {
      "bankBranchIDField" : "98543232" ,
      "bankBranchNameField" : "My New Bank Branch" ,
      "customerIDField" : "Eastern Bank"
    } ,
    {
      "bankBranchIDField" : "1235" ,
      "bankBranchNameField" : "North East Bank Branch" ,
      "customerIDField" : "Eastern Bank"
    }
  ] ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of bank branch records matching the given query: 2."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
  }
}

```

```
        "resultField" : 0
    } ,
    "tTRANSACTION_BANK_BRANCH_QUERYField" :
    {
        "bankBranchQueryRecordField" :
        {
            "bankBranchIDMaximumField" : null ,
            "bankBranchIDMinimumField" : null ,
            "bankBranchNameField" : null ,
            "customerIDField" : "Eastern Bank" ,
            "ifSearchExactField" : false ,
            "ifSearchExactFieldSpecified" : false
        } ,
        "dispatcherIDField" : "CentranSS"
    }
}
```

3.6.6 Web Service Bank Branch Transactions - Query Bank Branch Table Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the bank branch table matching the given query condition. This transaction uses the same format as the Bank Branch Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/bank-branch/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/bank-branch/query-count
```

Input Transaction:

```
<TRANSACTION_BANK_BRANCH_QUERY_COUNT>
  <BankBranchQueryRecord>
    <BankBranchIDMaximum>2900</BankBranchIDMaximum>
    <BankBranchIDMinimum>2800</BankBranchIDMinimum>
  </BankBranchQueryRecord>
  <DispatcherID/>
</TRANSACTION_BANK_BRANCH_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_BANK_BRANCH_QUERY_COUNT>
  <TRANSACTION_BANK_BRANCH_QUERY_COUNT>
    <BankBranchQueryRecord>
      <BankBranchIDMaximum>2900</BankBranchIDMaximum>
      <BankBranchIDMinimum>2800</BankBranchIDMinimum>
    </BankBranchQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_BANK_BRANCH_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of bank branch records matching the given query: 4.</Description>
  </ResultRecord>
  <QueryCount>4</QueryCount>
</RESPONSE_BANK_BRANCH_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran bank branch table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the bank branch table for a count of bank branches assigned to customer **Eastern Bank**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/bank-branch/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/bank-branch/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "bankBranchQueryRecordField" :
  {
    "bankBranchIDMaximumField" : null ,
    "bankBranchIDMinimumField" : null ,
    "bankBranchNameField" : null ,
    "customerIDField" : "Eastern Bank" ,
    "ifSearchExactField" : false ,
    "ifSearchExactFieldSpecified" : false
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "2" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of bank branch records matching the given query: 2."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_BANK_BRANCH_QUERY_COUNTField" :
  {
    "bankBranchQueryRecordField" :
    {
      "bankBranchIDMaximumField" : null ,
      "bankBranchIDMinimumField" : null ,
      "bankBranchNameField" : null ,
      "customerIDField" : "Eastern Bank" ,
      "ifSearchExactField" : false ,
      "ifSearchExactFieldSpecified" : false
    } ,
    "dispatcherIDField" : "CentranSS"
  }
}
```

3.7.1 Web Service Activity Log Transactions - Activity Log Table Query

CenTran Programming Reference Manual

This transaction queries an activity log table for a set of activity log records. The query record passed contains a set of activity log fields to create a query from. The record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Activity Data' form to search for audit or activity log records to be displayed in the activity log report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the activity log records are retrieved from the activity log table.

- Event Time Date range (Event Time Start and Event Time End)
- Lock Name
- Route Name
- User ID
- Lock Mode
- Customer ID
- Serial Number Range (Serial Number Start and Serial Number End)
- ATM Serial Number
- Region
- Search Exact Flag

Note

If string fields such as Lock Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for activity log records having an empty Lock Name or Customer ID field).

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the activity log records (with selected fields) matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open activity log table

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/event/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/event/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ACTIVITY_QUERY>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK014</LockName>
    <!-- char string -->
    <LockMode>F</LockMode>
    <!-- char string -->
    <RouteName></RouteName>
    <!-- char string -->
    <UserID>fjrb1</UserID>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ATMSerialNumber>asdfasd</ATMSerialNumber>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>true</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ACTIVITY_QUERY>
```

Output Transaction:

The transaction succeeds and returns a record which happens to be a reassign call event on lock VLK014.

```
<RESPONSE_ACTIVITY_QUERY>
  <TRANSACTION_ACTIVITY_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK014</LockName>
      <LockMode>F</LockMode>

  <BankBranchName />
  <BankUserID>0</BankUserID>
  <BankBranchID>0</BankBranchID>
</AuditRecord>
</RESPONSE_ACTIVITY_QUERY>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran activity log table query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the activity log table for events related to lock serial number **1037890** after **July 2014**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/event/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/event/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.7.2 Web Service Activity Log Transactions - Activity Log Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the activity log table query matching the given query condition. This transaction uses the same format as the Activity Log Table Query transaction.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/event/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/event/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ACTIVITY_QUERY_COUNT>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK014</LockName>
    <!-- char string -->
    <LockMode>F</LockMode>
    <!-- char string -->
    <RouteName></RouteName>
    <!-- char string -->
    <UserID>fjrb1</UserID>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ATMSerialNumber>asdfasd</ATMSerialNumber>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>true</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>
</TRANSACTION_ACTIVITY_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ACTIVITY_QUERY_COUNT>
  <TRANSACTION_ACTIVITY_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK014</LockName>
      <LockMode>F</LockMode>
      <RouteName></RouteName>
      <UserID>fjrb1</UserID>
      <CustomerID>ACustomer</CustomerID>
      <ATMSerialNumber>asdfasd</ATMSerialNumber>
      <Region>TestRegionD</Region>
      <SerialNumberMinimum>530000</SerialNumberMinimum>
      <SerialNumberMaximum>540000</SerialNumberMaximum>
      <EventDateStart>2004-12-24T00:00:00</EventDateStart>
      <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
      <IfSearchExact>true</IfSearchExact>
    </AuditQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ACTIVITY_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of audit record/s found satisfying the search condition: 1.
    </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_ACTIVITY_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the

enumerated value name. The following enumerated values are present in the CenTran activity log table query record count transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the activity log table for a count of **FLM** dispatches to lock serial number **1037890**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/event/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/event/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "auditQueryRecordField" :
  {
    "aTMSerialNumberField" : null ,
    "bankBranchIDMaximumField" : null ,
    "bankBranchIDMinimumField" : null ,
    "bankBranchNameField" : null ,

    } ,
    "dispatcherIDField" : "CentranSS"
}

```

3.7.3 Web Service Activity Log Transactions - Activity Log Archive Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the Activity Log Table Query, but is applied against the Activity Archive Log Table.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/archived-event/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/archived-event/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ACTIVITY_ARCHIVE_QUERY>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK</LockName>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>
</TRANSACTION_ACTIVITY_ARCHIVE_QUERY>
```

Output Transaction:

The transaction returns all activity archive records matching the given search fields and also an additional search field - that of region being 'TestRegionD' because the dispatcher belongs to that local region.

```
<RESPONSE_ACTIVITY_ARCHIVE_QUERY>
  <TRANSACTION_ACTIVITY_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran activity log archive table query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the activity log archive table for route dispatches to Route lock user **nr1**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/archived-event/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/archived-event/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.7.4 Web Service Activity Log Transactions - Activity Log Archive Table Query Record Count

CenTran Programming Reference Manual

This transaction operates in the same manner as the Activity Log Table Query Record Count, but is applied against the Activity Archive Log Table.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/archived-event/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/archived-event/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK</LockName>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>
</TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT xmlns="http://www.kaba-
mas.com/CentranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK</LockName>
      <SerialNumberMinimum>530000</SerialNumberMinimum>
      <SerialNumberMaximum>540000</SerialNumberMaximum>
      <EventDateStart>2004-12-24T00:00:00</EventDateStart>
      <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
      <IfSearchExact>0</IfSearchExact>
    </AuditQueryRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of audit archive record/s found satisfying the search condition: 2.
  </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ACTIVITY_ARCHIVE_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran activity log archive table query record count transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.

1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the activity log archive table for a count of operations Customer ID **North Bank** and Bank Branch Name **North Bank Branch**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/archived-event/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/archived-event/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "auditQueryRecordField" :
  {
    "aTMSerialNumberField" : null ,
    "bankBranchIDMaximumField" : null ,
    "bankBranchIDMinimumField" : null ,
    "bankBranchNameField" : "North Bank Branch" ,
    "bankModeUserIDMaximumField" : null ,
    "bankModeUserIDMinimumField" : null ,
    "customerIDField" : "North Bank" ,
    "effectuatedKeyField" : null ,
    "eventDateEndField" : null ,
    "eventDateEndFieldSpecified" : false ,
    "eventDateStartField" : null ,
    "eventDateStartFieldSpecified" : false ,
    "eventTypeField" : null ,
    "ifPossibleLockErrorOrIntrusionField" : false ,

        "serialNumberMinimumField" : null ,
        "userIDField" : null
    } ,
    "dispatcherIDField" : "CentranSS"
}
```

3.8.1 Web Service Authorization Transactions - Authorization Roles Table Query

CenTran Programming Reference Manual

This transaction queries the Authorization Roles table for a set of Authorization Role records. The input transaction file contains a query record which in turn contains a set of authorization role fields to create a query from. The authorization role query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization role records in the role table are retrieved.

- Authorization Role
- Description
- Enabled flag
- If Exclude Special Roles - This excludes roles such as FLM, Route, and Bank that are placeholders for lock key roles.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the role records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization role table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-role/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-role/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_ROLE_QUERY>
  <AuthorizationRoleQueryRecord>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
  </AuthorizationRoleQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_ROLE_QUERY>
```

Output Transaction:

The transaction succeeds in finding and retrieving an 'Enabled' authorization role named 'Dispatcher'.

```
<RESPONSE_AUTHORIZATION_ROLE_QUERY>
  <TRANSACTION_AUTHORIZATION_ROLE_QUERY>
    <AuthorizationRoleQueryRecord>
      <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
      <AuthorizationRole>Dispatcher</AuthorizationRole>
    </AuthorizationRoleQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_ROLE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization role records matching the given query: 1.
  </Description>
  </ResultRecord>
  <AuthorizationRoleRecord>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
    <AuthorizationRoleDescription>Used for normal dispatch and close operations.
  </AuthorizationRoleDescription>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
  </AuthorizationRoleRecord>
</RESPONSE_AUTHORIZATION_ROLE_QUERY>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization roles table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization role table to determine what authorization roles are present.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/authorization-role/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/authorization-role/query
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "authorizationRoleQueryRecordField" :
  {
    "authorizationRoleDescriptionField" : null ,
    "authorizationRoleField" : null ,
    "ifAuthorizationRoleEnabledField" : false ,
    "ifAuthorizationRoleEnabledFieldSpecified" : false ,
    "ifExcludeSpecialRolesField" : false ,
    "ifExcludeSpecialRolesFieldSpecified" : false
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "authorizationRoleRecordField" :
  [
    {
      "authorizationRoleDescriptionField" : "Used for setting up locks for installation." ,
      "authorizationRoleField" : "Activate Only" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "A new role" ,
      "authorizationRoleField" : "ARole" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "testing..." ,
      "authorizationRoleField" : "Authorization Testing" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "Void authorization role for Bank lock keys." ,
      "authorizationRoleField" : "Bank" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "Used for Bank Mode only installations (Default Role)." ,
      "authorizationRoleField" : "Bank Mode Only" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "" ,
      "authorizationRoleField" : "Copied Supervisor Role" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "IVR description" ,
      "authorizationRoleField" : "Copy IVR" ,
      "ifAuthorizationRoleEnabledField" : true
    } ,
    {
      "authorizationRoleDescriptionField" : "Customer dispatching for Detroit" ,

```

```

        "authorizationRoleField" : "Detroit Dispatching" ,
        "ifAuthorizationRoleEnabledField" : true
    } ,
    {
        "authorizationRoleDescriptionField" : "Used for normal dispatch and close operations." ,
        "authorizationRoleField" : "Dispatcher" ,

}
}

```

3.8.2 Web Service Authorization Transactions - Authorization Roles Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the authorization roles table matching the given query condition. This transaction uses the same format as the Authorization Roles Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-role/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-role/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
  <AuthorizationRoleQueryRecord>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
  </AuthorizationRoleQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_ROLE_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
    <AuthorizationRoleQueryRecord>
      <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
      <AuthorizationRole>Dispatcher</AuthorizationRole>
    </AuthorizationRoleQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization role records matching the given query: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_AUTHORIZATION_ROLE_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization role table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization role table for a count of available logon roles only, not lock user roles.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/archived-event/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/archived-event/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "authorizationRoleQueryRecordField" :
  {
    "authorizationRoleDescriptionField" : null ,
    "authorizationRoleField" : null ,
    "ifAuthorizationRoleEnabledField" : false ,
    "ifAuthorizationRoleEnabledFieldSpecified" : false ,
    "ifExcludeSpecialRolesField" : true ,
    "ifExcludeSpecialRolesFieldSpecified" : true
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "27" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of authorization role records matching the given query: 27."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNTField" :
  {
    "authorizationRoleQueryRecordField" :
    {
      "authorizationRoleDescriptionField" : null ,
      "authorizationRoleField" : null ,
      "ifAuthorizationRoleEnabledField" : false ,
      "ifAuthorizationRoleEnabledFieldSpecified" : false ,
      "ifExcludeSpecialRolesField" : true ,
      "ifExcludeSpecialRolesFieldSpecified" : true
    } ,
    "dispatcherIDField" : "CentranSS"
  }
}
```

3.8.3 Web Service Authorization Transactions - Authorization Operation Names Table Query

CenTran Programming Reference Manual

This transaction queries the authorization operation names table for a set of authorization operation name records. The query record passed contains a set of operation names fields to create a query from. This query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization operation names records in the operation names table are retrieved.

- Authorization Operation Name
- Authorization Operation Category

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the operation names records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization operation names table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-operation/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-operation/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
  <AuthorizationOperationQueryRecord>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
```

Output Transaction:

The transaction succeeds and all authorization operation names are retrieved.

```
<RESPONSE_AUTHORIZATION_OPERATION_QUERY>
  <TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
    <AuthorizationOperationQueryRecord>
      <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
    </AuthorizationOperationQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization operation name records matching the given query:
6.</Description>
  </ResultRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Add Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Customer Table Query</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Delete Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Read Customer Data</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Rename Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
```

```

    <AuthorizationOperationName>Update Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
</RESPONSE_AUTHORIZATION_OPERATION_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization operation name table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization operation name table to determine what user category authorization names are present.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/authorization-operation/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/authorization-operation/query
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "authorizationOperationQueryRecordField" :
  {
    "authorizationOperationCategoryField" : "User" ,
    "authorizationOperationNameField" : null
  } ,
  "dispatcherIDField" : null
}

```

Example Output Transaction - JSON:

```

{
  "authorizationOperationRecordField" :
  [
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Change Other User Password"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Change User Nickname"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Change User Open Windows"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Create User"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Delete User"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : "Read User Data"
    } ,
    {
      "authorizationOperationCategoryField" : "User" ,

```

```

        "authorizationOperationNameField" : "Rename User"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "Report On User Key"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "Set Clock In User Key"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "Update User Data"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "User Table Archive Query"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "User Table History Query"
    } ,
    {
        "authorizationOperationCategoryField" : "User" ,
        "authorizationOperationNameField" : "User Table Query"
    }
    ] ,
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "Number of authorization operation name records matching the given query: 13."
        ] ,
        "errorCodeField" : "RC_OK" ,
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "tTRANSACTION_AUTHORIZATION_OPERATION_QUERYField" :
    {
        "authorizationOperationQueryRecordField" :
        {
            "authorizationOperationCategoryField" : "User" ,
            "authorizationOperationNameField" : null
        } ,
        "dispatcherIDField" : "CentranSS"
    }
}

```

3.8.4 Web Service Authorization Transactions - Authorization Operation Names Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the operation names table matching the given query condition. This transaction uses the same format as the Authorization Operation Names Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-operation/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-operation/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <AuthorizationOperationQueryRecord>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
    <AuthorizationOperationQueryRecord>
      <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
    </AuthorizationOperationQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization operation name records matching the given query:
6.</Description>
  </ResultRecord>
  <QueryCount>6</QueryCount>
</RESPONSE_AUTHORIZATION_OPERATION_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization operation name table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization operation name table to determine how many user category authorization names are present.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/authorization-operation/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/authorization-operation/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "authorizationOperationQueryRecordField" :
  {
    "authorizationOperationCategoryField" : "User" ,
    "authorizationOperationNameField" : null
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "13" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of authorization operation name records matching the given query: 13."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNTField" :
  {
    "authorizationOperationQueryRecordField" :
    {
      "authorizationOperationCategoryField" : "User" ,
      "authorizationOperationNameField" : null
    } ,
    "dispatcherIDField" : "CentranSS"
  }
}
```

3.8.5 Web Service Authorization Transactions - Authorization Definition Table Query

CenTran Programming Reference Manual

This transaction queries the authorization definition table for a set of authorization definition records. The query record passed contains a set of definition fields to create a query from. The authorization definition query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization definition records in the definition table are retrieved.

- Authority Role
- Operation Name
- Operation Type
- Operation Parameter 1

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the authorization definition records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization definition table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-definition/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-definition/query
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
  <AuthorizationDefinitionQueryRecord>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
  </AuthorizationDefinitionQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
```

Output Transaction:

The transaction successfully retrieves all the roles authorized to activate a lock in FLM mode.

```

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization definition table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization definition table to determine what bank mode operations a dispatcher is permitted to do.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/authorization-definition/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/authorization-definition/query
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "authorizationDefinitionQueryRecordField" :
  {
    "authorizationOperationNameField" : null ,
    "authorizationOperationParameter1Field" : null ,
    "authorizationOperationTypeField" : "Bank" ,
    "authorizationRoleField" : "Dispatcher"
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "authorizationDefinitionRecordField" :
  [
    {
      "authorizationOperationNameField" : "Add Users To Lock" ,
      "authorizationOperationParameter1Field" : "" ,
      "authorizationOperationTypeField" : "Bank" ,
      "authorizationRoleField" : "Dispatcher"
    } ,
    {
      "authorizationOperationNameField" : "Change Other User Password" ,
      "authorizationOperationParameter1Field" : "" ,
      "authorizationOperationTypeField" : "Bank" ,
      "authorizationRoleField" : "Dispatcher"
    } ,
    {
      "authorizationOperationNameField" : "Change User Combination" ,
      "authorizationOperationParameter1Field" : "" ,
      "authorizationOperationTypeField" : "Bank" ,
      "authorizationRoleField" : "Dispatcher"
    } ,
    {
      "authorizationOperationNameField" : "Change User Nickname" ,
      "authorizationOperationParameter1Field" : "" ,
      "authorizationOperationTypeField" : "Bank" ,
      "authorizationRoleField" : "Dispatcher"
    } ,
    {
      "authorizationOperationNameField" : "Change User Open Windows" ,
```

```

        "authorizationOperationParameter1Field" : "" ,
        "authorizationOperationTypeField" : "Bank" ,
        "authorizationRoleField" : "Dispatcher"
    } ,
    {
        "authorizationOperationNameField" : "Delete Users From Lock" ,
        "authorizationOperationParameter1Field" : "" ,
        "authorizationOperationTypeField" : "Bank" ,
        "authorizationRoleField" : "Dispatcher"
    } ,
    {
        "authorizationOperationNameField" : "Deleted Lock History Table Query" ,
        "authorizationOperationParameter1Field" : "" ,
        "authorizationOperationTypeField" : "Bank" ,
        "authorizationRoleField" : "Dispatcher"
    } ,
    {

}
}

```

3.8.6 Web Service Authorization Transactions - Authorization Definition Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the authorization definition table matching the given query condition. This transaction uses the same format as the Authorization Definition Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/authorization-definition/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/authorization-definition/query-count
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <AuthorizationDefinitionQueryRecord>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
  </AuthorizationDefinitionQueryRecord>
  <DispatcherID/>
</TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
    <AuthorizationDefinitionQueryRecord>
      <AuthorizationOperationType>FLM</AuthorizationOperationType>
      <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    </AuthorizationDefinitionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of audit records matching the given query: 3.</Description>
  </ResultRecord>
  <QueryCount>3</QueryCount>
</RESPONSE_AUTHORIZATION_DEFINITION_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran authorization definition table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the authorization definition table to determine the count of different operations a dispatcher is permitted to do.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/authorization-definition/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/authorization-definition/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "authorizationDefinitionQueryRecordField" :
  {
    "authorizationOperationNameField" : null ,
    "authorizationOperationParameter1Field" : null ,
    "authorizationOperationTypeField" : null ,
    "authorizationRoleField" : "Dispatcher"
  } ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "146" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of audit records matching the given query: 146."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNTField" :
  {
    "authorizationDefinitionQueryRecordField" :
    {
      "authorizationOperationNameField" : null ,
      "authorizationOperationParameter1Field" : null ,
      "authorizationOperationTypeField" : null ,
      "authorizationRoleField" : "Dispatcher"
    } ,
    "dispatcherIDField" : "CentranSS"
  }
}
```

3.9.1 Web Service Region Transactions - Add Region

CenTran Programming Reference Manual

This transaction adds a region to the Cencon database region table. The region name must be a unique value.

Both locks and users can be assigned to a region. If a region has assigned locks and users, it can't be deleted.

If region control is set to be active in the Cencon system, then regions are used to restrict what data can be seen by those dispatch users without authorization to view information outside of their assigned region. Additionally, lock users can only be dispatched or assigned to locks within the same assigned region.

The Cencon system has two aspects of authorization. The first is the concept of authorization roles, which restricts what operations or transactions a user can do. The second is the concept of regions, which restricts what set of information a user has access to or what locks a lock user can be dispatched / assigned to. Region control can be set on or off, depending on your operational requirements.

There are two basic categories of users in the Cencon system. The first basic category is the lock users (FLM / Route / Bank) who are dispatched to open locks, or are assigned to be able to open a lock in bank mode. The second basic category is the Cencon / CenTran logon users, which can log onto either Cencon or access CenTran to do management and lock dispatch operations.

Region control affects the category of lock users by restricting what locks the users can be dispatched or assigned to.

Region control affects the category of Cencon / CenTran logon users by restricting what locks and users the log on user can view in Cencon or do operations to.

Individual regions have a flag associated with it, called region type. If the region type is 0, or regional, then the region affects both lock users and Cencon / CenTran logon users. If the region type is 1, or global, then the region affects lock users being dispatched / assigned to locks in the same region, but does not affect Cencon / CenTran logon users being able to view or manage information.

Having a region that is set as global, with a region type of 1, allows you to have a region assigned to Cencon / CenTran log on users at your corporate headquarters that are not restricted by region control. The region control affects lock users and locks in the same way, and affects Cencon / CenTran log on users in other regions in the same way, but your Cencon / CenTran log on users assigned to a region set as global are not affected.

Transaction information required:

- Region Name (Unique 64 character identifier)
- Region Type (1 is global, 0 is regional) (Optional, defaults to 0, regional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region already exists
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/add
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/add
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_ADD_REGION>
  <RegionRecord>
    <RegionName>Nashville</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
  <DispatcherID/>
</TRANSACTION_ADD_REGION>
```

Output Transaction:

The region is added successfully to the region table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_REGION) and a result record (indicating success).

```
<RESPONSE_ADD_REGION>
  <TRANSACTION_ADD_REGION>
    <RegionRecord>
      <RegionName>Nashville</RegionName>
      <RegionType>0</RegionType>
    </RegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_REGION>
```

```

<ResultRecord>
  <Result>Success</Result>
  <ErrorCode>RC_OK</ErrorCode>
  <IfRetryValid>>false</IfRetryValid>
  <Description>Region Nashville successfully added to the database.</Description>
</ResultRecord>
</RESPONSE_ADD_REGION>

```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/add
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/add
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_ADD_REGION>
  <RegionRecord>
    <RegionName>Kentucky</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
  <DispatcherID/>
</TRANSACTION_ADD_REGION>

```

Output Transaction:

In this example, region **Kentucky** already exists in the region table.

```

<RESPONSE_ADD_REGION>
  <TRANSACTION_ADD_REGION>
    <RegionRecord>
      <RegionName>Kentucky</RegionName>
      <RegionType>0</RegionType>
    </RegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ADD_REGION_ALREADY_EXISTS</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Region Kentucky already exists.</Description>
  </ResultRecord>
</RESPONSE_ADD_REGION>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add region transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example adds a region named **Timbuktu**. The value of **0** for **regionTypeField** indicates logon users assigned to this region are only able to see users and locks also assigned to this region.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/region/add
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/region/add
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "regionRecordField" :
  {
    "regionNameField" : "Timbuktu" ,
    "regionTypeField" : "0"
  }
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Region Timbuktu successfully added to the database."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_ADD_REGIONField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "regionRecordField" :
    {
      "regionNameField" : "Timbuktu" ,
      "regionTypeField" : "0"
    }
  }
}
```

3.9.2 Web Service Region Transactions - Read Region

CenTran Programming Reference Manual

This transaction reads a region from the database.

Transaction information required:

- Region Name

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the region record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Region does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/region/{regionname}/data
```

Example Input Transaction: (HTTP Get)

Note spaces are replaced by %20 within URLs.

```
https://kml-3242.domain.local/CentranService/rest/region/East%20Bank/data
```

Output Transaction:

```
<RESPONSE_READ_REGION>
  <TRANSACTION_READ_REGION>
    <RegionName>East Bank</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Success</Description>
  </ResultRecord>
  <RegionRecord>
    <RegionName>East Bank</RegionName>
    <RegionType>1</RegionType>
  </RegionRecord>
</RESPONSE_READ_REGION>
```

Example 2 - Failure

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/region/{regionname}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/region/NotValidRegion/data
```

Output Transaction:

Here, region **NotValidRegion** does not exist in the Cencon database region table.

```
<RESPONSE_READ_REGION>
  <TRANSACTION_READ_REGION>
    <RegionName>NotValidRegion</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find the region in the database region table. The region name
is not in the database region table.</Description>
  </ResultRecord>
</RESPONSE_READ_REGION>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read region transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example reads a region named **Timbuktu**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/{regionname}/data
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/Timbuktu/data
```

Example Output Transaction - JSON:

```
{
  "regionRecordField" :
  {
    "regionNameField" : "Timbuktu" ,
    "regionTypeField" : "0"
  } ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Success"
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_READ_REGIONField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "regionNameField" : "Timbuktu"
  }
}
```

3.9.3 Web Service Region Transactions - Update Region

CenTran Programming Reference Manual

This transaction updates data for an existing region in the database. The region fields to be updated have to be specified in the input transaction. Those region fields that are not specified in the input transaction will not be changed from their current values. The only region field that can be updated is the region type flag for global versus regional.

Transaction information required:

- Region Name
- Region Type (1 is global, 0 is regional) (Optional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated region record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_REGION>
  <UpdateRegionRecord>
    <RegionName>Kentucky</RegionName>
    <RegionType>1</RegionType>
  </UpdateRegionRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_REGION>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_REGION), a result record (indicating success) and the updated region record with new region type value.

```
<RESPONSE_UPDATE_REGION>
  <TRANSACTION_UPDATE_REGION>
    <UpdateRegionRecord>
      <RegionName>Kentucky</RegionName>
      <RegionType>1</RegionType>
    </UpdateRegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Region KENTUCKY successfully updated in the database.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_REGION>
```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_REGION>
  <UpdateRegionRecord>
    <RegionName>NoValidRegion</RegionName>
    <RegionType>1</RegionType>
  </UpdateRegionRecord>
```

```
<DispatcherID/>
</TRANSACTION_UPDATE_REGION>
```

Output Transaction:

The transaction fails because the region name **NoValidRegion** does not exist in the Cencon database region table.

```
<RESPONSE_UPDATE_REGION>
  <TRANSACTION_UPDATE_REGION>
    <UpdateRegionRecord>
      <RegionName>NoValidRegion</RegionName>
      <RegionType>1</RegionType>
    </UpdateRegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find region NoValidRegion in the region table.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_REGION>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a **+** indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran update region transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example updates a region named **Timbuktu**. The new value of **1** for **regionTypeField** indicates logon users assigned to this region are able to see users and locks not assigned to this region.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/region/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/region/update
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "updateRegionRecordField" :
  {
    "regionNameField" : "Timbuktu" ,
    "regionTypeField" : "1"
  }
}
```

Example Output Transaction - JSON:

```
{
  "regionRecordField" : null ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Region Timbuktu successfully updated in the database."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_UPDATE_REGIONField" :
```

```
{
  "dispatcherIDField" : "CentranSS" ,
  "updateRegionRecordField" :
  {
    "regionNameField" : "Timbuktu" ,
    "regionTypeField" : "1"
  }
}
```

3.9.4 Web Service Region Transactions - Delete Region

CenTran Programming Reference Manual

This transaction deletes a region from the database.

Transaction information required:

- Region Name

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region does not exist
- Not authorized due to authorization role

Example 1 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_REGION>
  <RegionName>NoRegion</RegionName>
  <DispatcherID/>
</TRANSACTION_DELETE_REGION>
```

Output Transaction:

```
<RESPONSE_DELETE_REGION>
  <TRANSACTION_DELETE_REGION>
    <RegionName>NoRegion</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_NOT_FOUND</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Failed to find region NoRegion in the region table.</Description>
  </ResultRecord>
</RESPONSE_DELETE_REGION>
```

Example 2 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/delete
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/delete
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_DELETE_REGION>
  <RegionName>North East Bank Region</RegionName>
  <DispatcherID/>
</TRANSACTION_DELETE_REGION>
```

Output Transaction:

```
<RESPONSE_DELETE_REGION>
  <TRANSACTION_DELETE_REGION>
    <RegionName>North East Bank Region</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
  </ResultRecord>
</RESPONSE_DELETE_REGION>
```

```
<Description>Region North East Bank Region has been deleted successfully.</Description>
</ResultRecord>
</RESPONSE_DELETE_REGION>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete region transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example deletes a region named **Timbuktu**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/region/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/region/delete
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "regionNameField" : "Timbuktu"
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Region Timbuktu has been deleted successfully."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_DELETE_REGIONField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "regionNameField" : "Timbuktu"
  }
}
```

3.9.5 Web Service Region Transactions - Region Table Query

CenTran Programming Reference Manual

This transaction queries the region table for a set of region records. The query record passed contains a set of region fields to create a query from. The region query does not have a 'like search' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the region records are retrieved from the region table.

- Region Name
- Region Type

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the region records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open region table

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/query
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/query
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_REGION_QUERY>
  <RegionQueryRecord>
    <RegionName>East</RegionName>
  </RegionQueryRecord>
  <DispatcherID/>
</TRANSACTION_REGION_QUERY>
```

Output Transaction:

The transaction retrieves all regions that have East in the name.

```
<RESPONSE_REGION_QUERY>
  <TRANSACTION_REGION_QUERY>
    <RegionQueryRecord>
      <RegionName>East</RegionName>
    </RegionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_REGION_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of region records matching the given query: 1.</Description>
  </ResultRecord>
  <RegionRecord>
    <RegionName>East Bank</RegionName>
    <RegionType>1</RegionType>
  </RegionRecord>
</RESPONSE_REGION_QUERY>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the

enumerated value name. The following enumerated values are present in the CenTran region table query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the region table for a region named **Timbuktu**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/region/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/region/query
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "regionQueryRecordField" :
  {
    "ifSearchExactField" : false ,
    "ifSearchExactFieldSpecified" : false ,
    "regionNameField" : "Timbuktu" ,
    "regionTypeField" : ""
  }
}
```

Example Output Transaction - JSON:

```
{
  "regionRecordField" :
  [
    {
      "regionNameField" : "Timbuktu" ,
      "regionTypeField" : "1"
    }
  ] ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of region records matching the given query: 1."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_REGION_QUERYField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "regionQueryRecordField" :
    {
      "ifSearchExactField" : false ,
      "ifSearchExactFieldSpecified" : false ,
      "regionNameField" : "Timbuktu" ,
      "regionTypeField" : ""
    }
  }
}
```

3.9.6 Web Service Region Transactions - Region Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the region table query matching the given query condition. This transaction uses the same format as the Region Table Query transaction.

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/region/query-count
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/region/query-count
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_REGION_QUERY_COUNT>
  <RegionQueryRecord>
    <RegionType>0</RegionType>
  </RegionQueryRecord>
  <DispatcherID/>
</TRANSACTION_REGION_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_REGION_QUERY_COUNT>
  <TRANSACTION_REGION_QUERY_COUNT>
    <RegionQueryRecord>
      <RegionType>0</RegionType>
    </RegionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_REGION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of region records matching the given query: 19.</Description>
  </ResultRecord>
  <QueryCount>19</QueryCount>
</RESPONSE_REGION_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran region table query record count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the region table for a count of regions assigned as global, not restricting logon user access to locks and users in the same region.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/region/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/region/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
```

```

"regionQueryRecordField" :
{
    "ifSearchExactField" : false ,
    "ifSearchExactFieldSpecified" : false ,
    "regionNameField" : null ,
    "regionTypeField" : "1"
}
}

```

Example Output Transaction - JSON:

```

{
    "queryCountField" : "25" ,
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "Number of region records matching the given query: 25."
        ] ,
        "errorCodeField" : "RC_OK" ,
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "tTRANSACTION_REGION_QUERY_COUNTField" :
    {
        "dispatcherIDField" : "CentranSS" ,
        "regionQueryRecordField" :
        {
            "ifSearchExactField" : false ,
            "ifSearchExactFieldSpecified" : false ,
            "regionNameField" : null ,
            "regionTypeField" : "1"
        }
    }
}

```

3.10.1 Web Service Remote Lock Management - Query Lock Status Across Network

CenTran Programming Reference Manual

This transaction is used to query the hardware and operational status of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from CenTran to read the lock status from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from CenTran to read the lock status. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.

Failure:

- Result record indicating failure

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/status
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CenTranService/rest/lock/status
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_STATUS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_STATUS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_STATUS>
  <TRANSACTION_LOCK_REMOTE_STATUS>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_STATUS>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Lock status queried from lock successfully.</Description>
  </ResultRecord>
  <LockRemoteStatusRecord>
    <ProductFamily>2</ProductFamily>
    <ProductCode>2</ProductCode>
    <MajorVersion>2</MajorVersion>
    <MinorVersion>0</MinorVersion>
    <BuildVersion>824</BuildVersion>
    <SerialNumber>001000107</SerialNumber>
    <IfDuressOpenInProgress>>false</IfDuressOpenInProgress>
    <IfDelayedOpenInProgress>>false</IfDelayedOpenInProgress>
    <IfBoltRetracted>>false</IfBoltRetracted>
    <IfShelvedOpenInProgress>>false</IfShelvedOpenInProgress>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran query lock status across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

Example

This example queries lock status through a remote CenTran lock agent persistent network connection:
LockSerialNumber:1037890

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/status
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/status
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iPAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "lockRemoteHardwareStatusRecordField" :
  {

3.10.2 Web Service Remote Lock Management - Query Lock Audits Across Network

CenTran Programming Reference Manual

This transaction is used to query the audits, hardware and operational status of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from CenTran to read the lock audits from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from CenTran to read the lock audits. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.
- All audit records read from the lock

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Failure:

- Result record indicating failure

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/audits
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/audits
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran query lock audits across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example queries lock audits through a remote CenTran lock agent persistent network connection:

LockSerialNumber:1037890

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/audits
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/audits
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "ipAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "lockEventAuditRecordField" :
  [
    {
      "aTMSerialNumberField" : "" ,
      "auditPKField" : "4892c143-a3b5-42da-95cd-3b38c219b12a" ,
      "bankBranchIDField" : "0" ,
      "bankBranchNameField" : "" ,
      "bankUserIDField" : "0" ,
      "clientIPAddressField" : "" ,
      "customerIDField" : "North Bank" ,
      "databaseLockAuditIndexField" : "0" ,
      "descriptionField" : "Gen2 Swingbolt 1037890 Lock Event: Route Mode Access Configuration
(Single\Dual) Write" ,
      "eventDateField" : "\/Date(1410382826000)\/" ,
      "eventResultField" : "0" ,
      "eventTypeField" : "ENV_LOCK_EVENT" ,
      "groupNameField" : "" ,
      "isLockClockBatteryIsLowField" : false ,
      "isLockCloseSealValidField" : false ,
      "isLockDuressComboUsedField" : false ,
      "isPossibleLockErrorOrIntrusionField" : false ,
      "lockAbbreviatedDeviceIDField" : null ,

3.10.3 Web Service Remote Lock Management - Evaluate Lock Event Across Network

CenTran Programming Reference Manual

This transaction is used to evaluate an event that has occurred at a Cencon Gen 2 or higher lock that is connected to a network IP address. The operational and hardware status is read from the lock, as well as any new audits that have occurred at the lock since the last time audits were read.

Any new audits from the lock are added to the Cencon database audit table. If a dispatch to the lock has resulted in the lock being opened and closed, the lock dispatch is closed out in the Cencon database. Any audits that indicate a possible error or intrusion into the lock are flagged in the Cencon database.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from CenTran to evaluate the lock events from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from CenTran to evaluate the lock events. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record, prior to actions taken by CenTran
- Lock operational status record, following actions taken by CenTran
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database. This will include the lock mode status record prior to actions taken by CenTran and the lock mode status record following actions taken by CenTran.
- Any Cencon audits resulting from the action taken by CenTran to evaluate the lock event. This will generally be if a dispatch to the lock was closed out.
- Any new audits from the lock indicating the event that occurred.

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Failure:

- Result record indicating failure

Example 1: Evaluating a lock open event.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/evaluate
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/evaluate
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
```

Output Transaction: Result of evaluating a lock open event.

```
<RESPONSE_LOCK_REMOTE_EVALUATE_EVENT>
  <TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran evaluate lock events across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example evaluates lock events though a remote CenTran lock agent persistent network connection:

LockSerialNumber:1037890

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/evaluate
```

Example Input Transaction (HTTP Post) - JSON:

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "IPAddressField" : null
}
```

Example Output Transaction - JSON:

```

3.10.4 Web Service Remote Lock Management - Activate Lock Across Network

CenTran Programming Reference Manual

This transaction is used to activate a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to activate.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to activate. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Activate Lock Serial Record** - Specifies the information to used activate the lock.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Activate Lock Serial Record:

- **Lock Name** - Lock name and mode is a unique identifier for a lock record. The lock name can be up to 64 characters. This is a required field.
- **Lock Mode** - The lock mode identifies a mode on a lock. This is a required field. It can be one of the following values:
 - **F** - This indicates FLM (First Line Maintenance) mode. This is a dispatched lock mode, supporting a single dispatch at a time. FLM lock users are dispatched a one time combination to open the lock with a specific electronic key.
 - **R** - This indicates Route mode. This is a dispatched lock mode, supporting up to three dispatches at a time. Route lock users are dispatched a one time combination to open the lock with a specific electronic key.
 - **B** - This indicates Bank mode. This lock mode uses a table of up to 100 bank mode users for a Cencon Gen 2 lock. Bank lock users must be added to the lock user table to be allowed to open the lock. Each Bank lock user can set their own fixed combination for opening the lock.
- **Serial Number** - This is the serial number of the lock being activated. This serial number must match the lock being activated, or the activation will not be permitted. This value can be retrieved from the lock by remote communications or by doing a #2 keypad command at the lock. This is a required field. Serial number and mode is another unique identifier for a lock record.
- **If Dual Mode** - This flag indicates if the lock requires a single user or dual users to open the lock. This setting can be changed after lock activation using the Lock Remote Set Single Dual Access transaction. This is a required field. Possible values for this field are 1, true, 0, false.
- **Customer ID** - This is a 64 character field to identify a customer ID. The customer ID is a unique identifier for a customer record in the Cencon database. This field can be left blank. If this value is set, it must match a valid Customer ID entry in the Cencon database Customer table.
- **ATM Serial Number** - This is a 64 character field to identify an ATM serial number. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 1** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 2** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 3** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 4** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 1** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 2** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 3** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 4** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Region** - This is a 64 character field to associate a region with the lock and mode. The region name must match an existing region record in the Cencon database. If region control is set to active for the Cencon system, then region is used to restrict what Cencon/CenTran dispatch users can view the lock in reports. It also restricts what lock users can be dispatched or assigned to the lock. If an FLM or Route lock user is associated with a different region, then they are not permitted to be dispatched to the lock. If a Bank lock user is associated with a different region, then they are not permitted to be added to the lock user table for Bank mode. This is an optional field, however if region control is active you will need to specify a region.
- **Service Branch** - This is a 64 character field to identify a service branch for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Address 1** - This is a 128 character field to allow an address to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Address 2** - This is a 128 character field to allow an address to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **City** - This is a 64 character field to allow a city to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **State** - This is a 32 character field to allow a state to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **ZIP** - This is a 16 character field to allow a postal service ZIP code to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Country** - This is a 32 character field to allow a country to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Time Zone ID** - This is a 64 character field to set the time zone ID for the lock. This field can be left blank. If this field is populated, the time zone ID must exactly match an operating system time zone ID, or an error will occur. If this field is left

blank, the CenTran server local time zone will automatically be used. This field is used to identify the time zone ID for the lock. The lock time zone ID is used to generate the daylight savings time transition table for the lock when the lock time is set. It is used for the lock to determine local time depending on the current daylight savings time offset. This affects lock user time windows, if any, in relation to the current local time. The daylight savings time transition table is initialized by lock mode, so it can be different for each lock mode. The lock daylight savings time transition table covers a period of 20 years. It is updated whenever the lock time is set. The lock daylight savings time transition table is generated from time zone information from the operating system, so if the operating system is out of date, the daylight savings time settings may be affected.

- **Bank Branch Name** - The bank branch name only applies to bank mode of the lock. If you are activating the bank mode of a lock, then this field must be set to match an existing Bank Branch in the Cencon database. The bank mode users you assign to the lock must also be assigned to the same bank branch as the lock.
- **Bank Mode User Name Array** - The bank mode user name array only applies to bank mode of the lock. The bank mode user name array is an array of user names for bank mode lock users to be assigned to the lock. If you are activating a bank mode lock, you must provide at least two users to be initially assigned to the lock. The user names specified must match valid bank mode lock user keys that are assigned to the same bank branch as the lock. If region control is active, then the bank mode lock users must also be assigned to the same region as the lock.
- **Bank Open Delay** - The bank open delay only applies to bank mode of the lock. This is the number of minutes (from 1 to 99) that a user will have to wait, after entering a combination and inserting the Personal Identifier Key before the lock will open. If no Time Delay to Open is desired, set this field to 0. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Open Window** - The bank open window only applies to bank mode of the lock. The second part of activating with Time Delay is the Window to Open. This specifies the amount of time, in minutes (from 1 to 99), in which a user must re-insert their key to open the lock after the Time Delay has expired. If the lock is not opened before the Window to Open elapses, the lock resets and the combination(s) and key(s) must be repeated, the time delay elapsed and then the lock opened. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.

Transaction information returned:

Success:

- Result record indicating success
- Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Note

The Cencon Gen 2 lock supports daylight savings time changes through the use of a time offset transition table. This table contains up to 40 entries, which is sufficient for 20 years of operation with two transitions a year. This table is initialized for each lock mode when the lock mode is activated. It is also updated when the time is updated on the lock.

The daylight savings time transition table for the Cencon Gen 2 lock is generated from the selected time zone, using daylight saving time information from the host computer. If the time zone ID is not specified when activating a lock, then the currently set time zone on the host computer is used.

The following is a table of available time zone IDs for the Windows operating system using English. Other language installations may make use of different language time zone IDs.

Windows Time Zone IDs:

UTC Offset	Time Zone ID
-12:00:00	Dateline Standard Time

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran activate lock across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.

1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example activates **FLM** lock mode of lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/activate
```

Example Input Transaction (HTTP Post) - JSON:

3.10.5 Web Service Remote Lock Management - Add Users To Bank Mode Lock Across Network

CenTran Programming Reference Manual

This transaction is used to add users to the bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to add users to.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to add users to. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to add users to.
- **Lock Mode** - This is the lock mode of the lock that you are going to add users to. This transaction currently only applies to bank mode locks.
- **Bank Mode User Name Array** - This is an array of user IDs specifying what bank mode lock users to add to the lock. These must be valid existing bank mode lock users in the Cencon database. They must be assigned to the same bank branch as the lock. If region control is active, they must be assigned to the same region as the lock. They must not already be assigned to the lock. Additionally, the bank mode lock user table must have sufficient space for the added users. The Cencon Gen 2 bank mode can have up to 100 users assigned to it.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/add-users
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/add-users
```

Example Input Transaction: (HTTP Body)

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add users to bank mode lock across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.

1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example adds bank mode users to the **Bank** mode of lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/add-users
```

3.10.6 Web Service Remote Lock Management - Delete Users From Bank Mode Lock Across Network

CenTran Programming Reference Manual

This transaction is used to delete users from the bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to delete users from.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to delete users from. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to delete users from.
- **Lock Mode** - This is the lock mode of the lock that you are going to delete users from. This transaction currently only applies to bank mode locks.
- **Bank Mode User Name Array** - This is an array of user IDs specifying what bank mode lock users to delete from the lock. These must be valid existing bank mode lock users in the Cencon database. They must be assigned to the lock. Additionally, the Cencon Gen 2 lock is required to have two bank mode users set up. It is not permitted to delete the last two users from the Cencon Gen 2 lock bank mode.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/delete-users
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/delete-users
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_DELETE_USERS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock_1000107</LockName>
  <LockMode>B</LockMode>
  <BankModeUserNameArray>
    <UserID>BU02</UserID>
    <UserID>BU03</UserID>
    <UserID>BU04</UserID>
  </BankModeUserNameArray>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_DELETE_USERS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_DELETE_USERS>
  <TRANSACTION_LOCK_REMOTE_DELETE_USERS>
    <IPAddress>10.108.6.121:35005</IPAddress>
```

```

<CommunicationsID/>
<CommunicationsMethod>Tcp</CommunicationsMethod>
<LockName>Gen2Lock 1000107</LockName>
<LockMode>B</LockMode>
<BankModeUserNameArray>
  <UserID>BU02</UserID>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete users from bank mode lock across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example deletes bank mode users from the **Bank** mode of lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```

3.10.7 Web Service Remote Lock Management - Shelf Lock Across Network

CenTran Programming Reference Manual

This transaction is used to shelve a mode of a Cencon Gen 2 or higher lock that is connected to a network IP address. This transaction only shelves the specified lock mode. If other modes of the lock are active, they will not be affected by this transaction and will remain active. If all three modes of the lock are active, you will have to call this transaction three times to completely shelve all modes of the lock.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to shelve.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to shelve. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to shelve.
- **Lock Mode** - This is the lock mode of the lock that you are going to shelve.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

If the Cencon configuration option to require a change key be present in the lock for remote shelve is set, you will not be able to remotely shelve the lock across a remote connection without first having someone present to open the lock and insert a change key. In the case of the Cencon Gen 2 swing bolt lock, you can alternatively open the lock and enter #50 at the lock to allow remote administration of the lock. Refer to the Cencon application Change Configuration Settings dialog to set this configuration option in the Cencon database.

The error code **RC_ERR_SHELVE_LOCK_SERIAL_CHANGE_KEY_NOT_PRESENT** will be returned by CenTran if this error occurs.

Transaction information returned:

Success:

- Result record indicating success
- Shelved Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/shelve
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/shelve
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_SHELVE>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>B</LockMode>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_SHELVE>
```

Output Transaction:

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This field is used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran shelf lock across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example shelves **FLM** lock mode of lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/shelve
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/shelve
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "ipAddressField" : null ,
  "lockModeField" : 0 ,
  "lockNameField" : "Gen2 Swingbolt 1037890"
}
```

Example Output Transaction - JSON:

```

3.10.8 Web Service Remote Lock Management - Set Lock Time Across Network

CenTran Programming Reference Manual

This transaction is used to set lock time and time zone daylight savings time transition table of a Cencon Gen 2 or higher lock that is connected to a network IP address. This transaction only sets the daylight savings time transition table for the specified lock mode. If other modes of the lock are active and you want to set the daylight savings time transition table for them as well, you will need to call this transaction for them also.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set lock time and time zone daylight savings time transition table.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set lock time and time zone daylight savings time transition table. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to set lock time and time zone daylight savings time transition table.
- **Lock Mode** - This is the lock mode of the lock that you are going to set lock time and time zone daylight savings time transition table.
- **Time Zone ID** - This is a 64 character field to set the time zone ID for the lock. This field can be left blank. If this field is populated, the time zone ID must exactly match an operating system time zone ID, or an error will occur. If this field is left blank, the CenTran server local time zone will automatically be used. This field is used to identify the time zone ID for the lock. The lock time zone ID is used to generate the daylight savings time transition table for the lock when the lock time is set. It is used for the lock to determine local time depending on the current daylight savings time offset. This affects lock user time windows, if any, in relation to the current local time. The daylight savings time transition table is initialized by lock mode, so it can be different for each lock mode. The lock daylight savings time transition table covers a period of 20 years. It is updated whenever the lock time is set. The lock daylight savings time transition table is generated from time zone information from the operating system, so if the operating system is out of date, the daylight savings time settings may be affected.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/set-time
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/set-time
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_SET_TIME>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>B</LockMode>
  <TimeZoneID>Central Standard Time</TimeZoneID>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_SET_TIME>
```

Output Transaction:

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran set lock time across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.

2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example sets the time and daylight savings time table for **FLM** mode of lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/set-time
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/set-time
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "ipAddressField" : null ,
  "lockNameAndModeField" :
  {
    "lockModeField" : 0 ,
    "lockNameField" : "Gen2 Swingbolt 1037890"
  } ,
  "timeZoneIDField" : "Eastern Standard Time"
}
```

Example Output Transaction - JSON:

```
{
  "lockRecordField" :
  {
    "atMSerialNumberField" : "North Bank ATM 101" ,
    "address1Field" : "749 W. Short St." ,

3.10.9 Web Service Remote Lock Management - Set Lock Single Dual Access Across Network

CenTran Programming Reference Manual

This transaction is used to set single or dual access of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set single or dual access.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set single or dual access. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to set single or dual access.
- **Lock Mode** - This is the lock mode of the lock that you are going to set single or dual access.
- **If Dual Mode** - This is a flag indicating that the lock is to be set to dual mode. If this flag is 1 or true, then the lock will be set to dual user access. If this flag is 0 or false, then the lock will be set to single user access.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/set-access
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/set-access
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <IfDualMode>true</IfDualMode>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
  <TRANSACTION_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
    <IPAddress>10.108.6.121:35005</IPAddress>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran set lock single dual access across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example sets **FLM** mode to be dual user to open for a lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/set-access
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/set-access
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "ipAddressField" : null ,
  "ifDualModeField" : true ,
  "lockModeField" : 0 ,
  "lockNameField" : "Gen2 Swingbolt 1037890"
}
```

Example Output Transaction - JSON:

```

3.10.10 Web Service Remote Lock Management - Set Lock Open Delay Window Across Network

CenTran Programming Reference Manual

This transaction is used to set the lock open delay and open time window of a bank mode Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set the lock open delay and open time window.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set the lock open delay and open time window. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to set the lock open delay and open time window.
- **Lock Mode** - This is the lock mode of the lock that you are going to set the lock open delay and open time window. This is currently always going to be bank mode. FLM and Route lock modes do not support an open delay and open time window.
- **Bank Open Delay** - This is an integer value representing the number of minutes of the bank mode open delay. If this value is set to 0 then the **Bank Open Window** must also be set to 0. If this value is set to some number of minutes greater than 0, then the **Bank Open Window** must also be set to some number of minutes greater than 0.

This delay will be applied to bank mode users attempting to open the lock. If the bank mode user enters a valid combination with a valid key and a bank mode open delay is set, then the lock will go into a wait state before allowing the same bank mode user to use their key again to open the lock. The **Bank Open Delay** defines how long in minutes the user has to wait before opening the lock.

- **Bank Open Window** - This is an integer value representing the number of minutes of the bank mode open window. If this value is set to 0 then the **Bank Open Delay** must also be set to 0. If this value is set to some number of minutes greater than 0, then the **Bank Open Delay** must also be set to some number of minutes greater than 0.

This open window will be applied to bank mode users attempting to open the lock. If the bank mode user enters a valid combination with a valid key and a bank mode open delay is set, then the lock will go into a wait state before allowing the same bank mode user to use their key again to open the lock. The **Bank Open Window** defines how long in minutes the user has to open the lock after the delay is complete.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/set-open-delay-window
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/set-open-delay-window
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_SET_OPEN_DELAY_WINDOW>
```

```
<IPAddress>10.108.6.96:35005</IPAddress>
<CommunicationsID/>
<CommunicationsMethod>Tcp</CommunicationsMethod>
<LockName>Gen2Lock 1000107</LockName>
<LockMode>B</LockMode>
<BankOpenDelay>6</BankOpenDelay>
<BankOpenWindow>3</BankOpenWindow>
<DispatcherID/>
</TRANSACTION_LOCK_REMOTE_SET_OPEN_DELAY_WINDOW>
```

Output Transaction:

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran set lock open delay window across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.

2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example sets **Bank** mode open delay window for a lock named **Gen2 Swingbolt 1037890** though a remote Centran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/set-open-delay-window
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/set-open-delay-window
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "bankOpenDelayField" : "5" ,
  "bankOpenWindowField" : "5" ,
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,

3.10.11 Web Service Remote Lock Management - Resynchronize Lock Dispatching Across Network

CenTran Programming Reference Manual

This transaction is used to resynchronize dispatching of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to resynchronize dispatching.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to resynchronize dispatching. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to resynchronize dispatching.
- **Lock Mode** - This is the lock mode of the lock that you are going to resynchronize dispatching. This transaction currently only applies to FLM and Route mode locks.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/resynchronize-dispatching
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/resynchronize-dispatching
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_RESYNC_DISPATCHING>
  <TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>
    <IPAddress>10.108.6.121:35005</IPAddress>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran resynchronize lock mode dispatching across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example resynchronizes dispatching for **FLM** mode for a lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/resynchronize-dispatching
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/resynchronize-dispatching
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,

```

3.10.12 Web Service Remote Lock Management - Resynchronize Bank Mode Lock Users Across Network

CenTran Programming Reference Manual

This transaction is used to resynchronize users for bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to resynchronize users.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to resynchronize users. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to resynchronize users.
- **Lock Mode** - This is the lock mode of the lock that you are going to resynchronize users. This transaction currently only applies to Bank mode locks.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record
- Array of bank mode lock user IDs that were added to the lock data in the Cencon database
- Array of bank mode lock user IDs that were removed from the lock data in the Cencon database
- Array of bank mode lock user IDs that failed to be added to the lock data in the Cencon database. This may be because a user assigned to the lock no longer exists in the database.
- Array of bank mode lock user IDs that failed to be removed from the lock data in the Cencon database. This should not normally occur, but may happen because of a database error.

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/resynchronize-users
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/resynchronize-users
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_RESYNC_USERS>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran resynchronize bank mode lock users across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.

1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example resynchronizes assigned lock users for **Bank** mode for a lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/resynchronize-users
```

Example Input Transaction (HTTP Post) - JSON:

```

3.10.13 Web Service Remote Lock Management - Cancel Dispatch and Advance To Next Lock Mode Combination Across Network

CenTran Programming Reference Manual

This transaction is used to cancel the dispatch of a mode of a Cencon Gen 2 or higher lock that is connected to a network IP address. It does this by checking the status of the lock to determine if the dispatched user has reached the lock and opened it. If the user has opened and closed the lock, this transaction closes out the dispatch and returns that the user already opened the lock. If the user has not opened the lock, then the combination for that mode of the lock is advanced to the next combination at the lock, and the dispatch is force closed in the Cencon database.

If this transaction is used and the lock is dispatched on one or more route sequences, each call to this transaction will cancel the dispatch for the next route sequence. If the lock was dispatched on route sequence 1, 2, and 3, then the first call will cancel the dispatch for route sequence 1, the second call will cancel the dispatch for route sequence 2, and the third call will cancel the dispatch for route sequence 3. If a route sequence is skipped, such as sequences 2 and 3 are the only ones dispatched, then sequence 1 will be dispatched and closed to prevent it from being used and the combination for the lock mode will be advanced.

If this transaction is used without a dispatched user, then the combination of the mode of the lock is advanced at the lock and in the Cencon database.

If this transaction is used and the lock is currently open, then an error will be returned.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to cancel dispatch and advance combination.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to cancel dispatch and advance combination. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to cancel dispatch and advance combination.
- **Lock Mode** - This is the lock mode of the lock that you are going to cancel dispatch and advance combination.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record
- Lock status record
- Lock hardware status record
- Lock mode status record
- IfUserOpenedClosedLockDispatch flag - Indicates if the user has already opened and closed the dispatch to the lock.
- IfAdvancedToNextLockCombo - Indicates if the lock mode was advanced to it's next combination.
- IfCancelledDispatch - Indicates if a dispatch was canceled in the Cencon database.
- IfAffectedRouteSequence - Indicates if a route mode was affected for cancelling a dispatch.
- AffectedRouteSequence - Value of the route mode that was affected for cancelling a dispatch. If present, this could be a value from 1 to 3.
- IfDuressComboUsedOnOpen - If the user has already opened and closed the dispatch, this indicates if a duress combination was used.
- IfClockBatteryLowOrResetOnOpen - If the user has already opened and closed the dispatch, this indicates if the clock battery was low or reset upon lock being opened.
- LockLogRecord - If present, these are the lock log records found to be dispatched at the time of the transaction for the specified lock mode.
- CanceledLockLogRecord - If present, this is the lock log record closed out by the transaction.

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/cancel-dispatch
```

Example Input Transaction: (HTTP Post)

https://kml-3242.domain.local/CentranService/rest/lock/cancel-dispatch

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_CANCEL_DISPATCH>
  <IPAddress>10.108.6.108:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2 Swingbolt 1037890</LockName>
  <LockMode>R</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_CANCEL_DISPATCH>
```

Output Transaction:

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran cancel dispatch and advance to next lock mode combination across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example cancels the dispatch and advances the combination of **FLM** mode of a lock named **Gen2 Swingbolt 1037890** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1037890**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/cancel-dispatch
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/cancel-dispatch
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "ipAddressField" : null ,
  "lockModeField" : 0 ,
  "lockNameField" : "Gen2 Swingbolt 1037890"
}
```

Example Output Transaction - JSON:

```

3.10.14 Web Service Remote Lock Management - Input Dispatched Combination to Lock and Lock Prompt for User Key (IPI)

CenTran Programming Reference Manual

This transaction is used to input a currently dispatched combination to the remotely connected lock.

Upon receiving the combination, the lock checks if the specified lock mode is in a closed state. If the lock mode is not closed, if the bolt is retracted or the container door switch indicates open, then an error will be returned by the lock.

If the lock mode is closed and the lock is physically closed, the lock will return a success result and stop accepting further remote serial communications. Please note, a success result from the lock for this operation only means that the combination(s) have been accepted. It does not mean the combination(s) match the lock user key(s) or that the user has successfully opened the lock.

The lock will then prompt IPI for the first matching lock user key. The lock user present at the lock is required to present the matching lock user key to the lock key reader. If the combination matches with the key, the lock will open.

If the lock is in dual access mode, it will first prompt IPI for the first matching lock user key. After the first lock user key has been successfully presented, it will then prompt IP2 for the second lock user key. After the second lock user key has been successfully presented, the lock will compare the first combination with the first lock user key and the second combination with the second lock user key. If both combinations match the appropriate lock user key, the lock will open.

Caution

If the lock is in dual access mode, the lock user keys must be presented in the same order as specified in the dispatch of the users to the lock. If the keys are presented in reverse order to the lock, the comparison of the combinations to the keys will be reversed and the lock will display an error.

If this transaction is used and the lock is dispatched on one or more route sequences, a route sequence must be specified. This is the same as usage of route sequences by lock users dispatched on a route. The route sequence must be dispatched, and must be in the range of 1 to 3.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to input combination to.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to input combination to. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to input combination to.
- **Lock Mode** - This is the lock mode of the lock that you are going to input combination to.
- **Route Sequence Number** - This is the route sequence number of the dispatch that you are going to input to the lock. This value should be 0 if not dispatched on a route. If dispatched on a route, it can be a value of 1 to 3.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record including dispatch information

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

Once the command to input a combination is successfully accepted by the lock, it will return back a success reply and then halt further remote communications. The lock will then begin prompting the user or users for their lock keys. After the lock has been opened, or the user has failed to successfully present the correct lock user key, the lock will reboot. After the lock has rebooted, it will be available for remote communications again.

Example

This example inputs the dispatched combination for **route sequence 3** of **Route** mode of a lock named **Gen2 Swingbolt 1158563** though a remote CenTran lock agent direct network connection: **10.108.6.104:35005**

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/input-combo-prompt-ipi
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CenTranService/rest/lock/input-combo-prompt-ipi
```

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
  <IPAddress>10.108.6.104:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2 Swingbolt 1158563</LockName>
  <LockMode>R</LockMode>
  <LockSequence>3</LockSequence>
  <DispatcherID></DispatcherID>
</TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_INPUT_COMBO_IPI>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran input combination across network and prompt IPI transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example inputs the dispatched combination of **FLM** mode of a lock named **Gen2 Swingbolt 1158563** though a remote Centran lock agent persistent network connection: **LockSerialNumber:1158563**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/input-combo-prompt-ipi
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/input-combo-prompt-ipi
```

Example Input Transaction (HTTP Body) - JSON:

```

3.10.15 Web Service Remote Lock Management - Reboot Lock Across Network

CenTran Programming Reference Manual

This transaction is used to reboot a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to reboot.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to reboot. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/reboot
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242/CentranService/rest/lock/reboot
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_LOCK_REMOTE_REBOOT>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_LOCK_REMOTE_REBOOT>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_REBOOT>
  <TRANSACTION_LOCK_REMOTE_REBOOT>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_REBOOT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Lock rebooted successfully.</Description>
  </ResultRecord>
</RESPONSE_LOCK_REMOTE_REBOOT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time

since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran reboot lock across network transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example reboots a lock through a remote CenTran lock agent persistent network connection:
LockSerialNumber:1037890

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/reboot
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/reboot
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "LockSerialNumber:1037890" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iPAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Lock rebooted successfully."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_LOCK_REMOTE_REBOOTField" :
  {
    "communicationsIDField" : "LockSerialNumber:1037890" ,
    "communicationsMethodField" : 1 ,
    "dispatcherIDField" : "CentranSS" ,
    "iPAddressField" : null
  }
}
```

5.1 Web RSS Feeds - Help

CenTran Programming Reference Manual

This transaction is used to read the CenTran RSS feeds help.

Transaction information required:

- No information required.

Transaction information returned:

Success:

An HTML based help page listing available information for the CenTran web service transactions.

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction:

```
https://{host}/CentranFeedsService/help
```

Output Transaction:

Operations at <https://kml-3242.domain.local/CenTranFeedsService/>

This page describes the service operations at this endpoint.

Uri	Method	Description
event-html/{eventid}	GET	Returns the audit HTML description for the indicated event id.
lock-errors	GET	Returns an RSS feed formatted as text of lock errors that have occurred within the last month.
lock-events/{serialnumber}	GET	Returns an RSS feed formatted as text of lock events that have occurred within the last month.

5.2 Web RSS Feeds - Lock Errors RSS Feed

CenTran Programming Reference Manual

This is a subscription RSS feed of lock errors queried from the Cencon database that have occurred within the last month. It is accessible from any major web browser or news subscription application. This feed is intended of being one way of being alerted to lock errors in a timely manner as they occur.

You can subscribe to this RSS feed in order to be notified of lock errors. This can be done using Internet Explorer, Firefox, or any of a number of specialized RSS feed subscription applications.

How rapidly you are notified of an error occurring is dependent on the rate that your RSS feed subscription application is polling for updates from CenTran. The default rate for Internet Explorer is every 15 minutes. The default rate for Firefox is every 60 minutes. You can adjust the default rate that your RSS feed subscription application polls for updates.

For this feed to be effective, it requires the Cencon locks to be monitored by CenTran Agent software on the ATM consoles they are connected to. When a lock has an event occur, the CenTran Agent software receives the alert message for the event from the lock. The CenTran Agent software uses the CenTran Web Service transaction to evaluate the lock event across the network, and receives information about what event has occurred and what the current status of the lock is.

As part of evaluating the event at the lock, CenTran also updates the Cencon database audit table with any lock audit records that have occurred. The lock audit records in the Cencon database audit table can be used to be notified of lock errors that have occurred, either through the RSS feed from CenTran or by your own custom solution using direct access to the Cencon database audit table.

RSS Feed subscription information required:

- None

Example

RSS Feed URL format:

```
https://{host}/CentranFeedsService/lock-errors
```

Example RSS Feed URL:

```
https://kml-3242.domain.local/CenTranFeedsService/lock-errors
```

5.3 Web RSS Feeds - Lock Events By Serial Number RSS Feed

CenTran Programming Reference Manual

This is a subscription RSS feed of lock events for a queried from the Cencon database that have occurred within the last month. It is accessible from any major web browser or news subscription application. This feed is intended of being one way of being alerted to lock errors in a timely manner as they occur.

You can subscribe to this RSS feed in order to be notified of lock errors. This can be done using Internet Explorer, Firefox, or any of a number of specialized RSS feed subscription applications.

How rapidly you are notified of an error occurring is dependent on the rate that your RSS feed subscription application is polling for updates from CenTran. The default rate for Internet Explorer is every 15 minutes. The default rate for Firefox is every 60 minutes. You can adjust the default rate that your RSS feed subscription application polls for updates.

For this feed to be effective, it requires the Cencon locks to be monitored by CenTran Agent software on the ATM consoles they are connected to. When a lock has an event occur, the CenTran Agent software receives the alert message for the event from the lock. The CenTran Agent software uses the CenTran Web Service transaction to evaluate the lock event across the network, and receives information about what event has occurred and what the current status of the lock is.

As part of evaluating the event at the lock, CenTran also updates the Cencon database audit table with any lock audit records that have occurred. The lock audit records in the Cencon database audit table can be used to be notified of lock errors that have occurred, either through the RSS feed from CenTran or by your own custom solution using direct access to the Cencon database audit table.

RSS Feed subscription information required:

- None

Example

RSS Feed URL format:

```
https://{host}/CentranFeedsService/lock-events/{SERIALNUMBER}
```

Example RSS Feed URL:

```
https://kml-3242.domain.local/CenTranFeedsService/lock-events/1000107
```

CenTran 5.4.0.4378 XML Programming Reference Manual 28 Jun 2019

6.1 Web Service CenTran Agent Service Endpoint - Summary

CenTran Programming Reference Manual

The CenTran web service exposes a lower security endpoint for support of the CenTran Agent ATM operations. The transactions available on this endpoint either provide some information without changing data, or update the Cencon database depending on the status of a Cencon Gen 2 lock. None of the transactions involve actually introducing new external data into the Cencon database.

The CenTran Agent Service Endpoint is at the following encrypted URL by default:

```
https://{host}/CentranAgentService/rest/
```

The CenTran Agent Service Endpoint is also at the following unencrypted URL by default:

```
http://{host}/CentranAgentService/rest/
```

The unencrypted URL is available for use, but is not recommended. It is preferable to set up the certificates for your CenTran server on any client systems, and use the encrypted URL.

It is required to use encryption with the main CenTran endpoint because authentication is in use. Since the CenTran Agent transactions only allow updating data from locks, no authentication is required. Encryption is still recommended, however.

The transactions exposed off of this endpoint do not require external authentication of the call to the web service. The default authentication for CenTran is automatically used. This is to avoid having to support independent authentication for the transactions occurring in an automated fashion from ATMs that the CenTran Agent Service is installed on.

The following transactions are made available on this endpoint. These transactions operate in exactly the same manner as if being called from the normal CenTran web service endpoint, with the exception of authentication.

- [Query Lock Status Across Network](#)
- [Query Lock Audits Across Network](#)
- [Evaluate Lock Event Across Network](#)
- [Version](#)

6.2 Web Service CenTran Agent Service Endpoint - Help

CenTran Programming Reference Manual

This transaction is used to read the Web Service CenTran Agent Service Endpoint help.

Transaction information required:

- No information required.

Transaction information returned:

Success:

An HTML based help page listing available information for the Web Service CenTran Agent Service Endpoint transactions.

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction:

```
https://{host}/CentranAgentService/rest/help
```

Output Transaction:

Operations at <https://kml-3242.domain.local/CenTranAgentService/rest/>

This page describes the service operations at this endpoint.

Uri	Method	Description
lock/audits	POST	Returns audits by remotely accessing the lock at the given IP address
lock/evaluate	POST	Evaluates and returns event and status information by remotely accessing the lock at the given IP address
lock/status	POST	Returns status information by remotely accessing the lock at the given IP address
version	GET	Returns the product version information and server time for the web service

Appendix A - Error Codes

CenTran Programming Reference Manual

The following is an extensive list of error codes (with description) that CenTran could return when the incoming transaction file format is XML:

Message Name	Message Description
RC_OK	Success.
RC_PARTIAL_OK	Partial Success
RC_NOT_OK	Failure
RC_ERR_FAILED_VALIDATE_FILE	Failed to validate file against the given XML schema
RC_ERR_DISPATCHER_NOT_FOUND	Failed to find the dispatcher or logon user in the database user table. The dispatcher ID is not in the database user table
RC_ERR_DISPATCHER_NOT_SET	Dispatcher ID has not been set
RC_ERR_FAILED_READ_CONFIG_SETTINGS	Failed to read configuration settings from database
RC_ERR_LOCK_NOT_FOUND	Lock not found in lock table
RC_ERR_INVALID_LOCK_REC_LOCKNAME	Invalid lock record. The lock name is blank or contains unprintable characters
RC_ERR_FAILED_GET_DISPATCHER_REGION	Failed to get assigned region for dispatcher authorization
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the lock's region
RC_ERR_INVALID_LOCK_REC_RECTYPE	Invalid lock record. The lock record type is not set to either active, being installed, pending shelve, shelved, or being replaced
RC_ERR_LOCK_ALREADY_OPEN	Lock already opened
RC_ERR_LOCK_NOT_OPEN	Lock not open
RC_ERR_FLM1_BLANK	First RSP/FLM ID is blank
RC_ERR_FLM2_BLANK	Second RSP/FLM ID is blank
RC_ERR_FLM1_AND_FLM2_ARE_THE_SAME	Dual mode lock - The first and second user are the same user I.D.
RC_ERR_PCIO	PCIO Card error
RC_ERR_INVALID_LOCK_MODE	Invalid lock mode
RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION	Logon User ID Authorization Role does not authorize this operation
RC_ERR_DATABASE_CLOSED	Database connection is closed
RC_ERR_FAILED_BEGIN_TRANS	Failed to begin database transaction
RC_ERR_FAILED_COMMIT_TRANS	Failed to commit database transaction
RC_ERR_DISPATCH_LOCK_ROUTE_REGION_MISMATCH	Lock being dispatched on route does not have the same region as the route
RC_ERR_DISPATCH_LOCK_INVALID_SEQ	Failed to dispatch lock. Route sequence number is out of range
RC_ERR_DISPATCH_LOCK_PENDING_SHELVE	Lock pending shelve and cancelled by user
RC_ERR_LOCK_NOT_ACTIVE	Lock not active
RC_ERR_FAILED_TO_ENCRYPT_DATA	Failed to encrypt data. The data may have been corrupted, or the Cencon USB Key Box encryption data may be in error
RC_ERR_FAILED_TO_DECRYPT_DATA	Failed to decrypt data. The data may have been corrupted, or the Cencon USB Key Box encryption data may be in error
RC_ERR_CANT_SERVICE_LOCK_FLM1	First RSP/FLM ID may not service the lock
RC_ERR_CANT_SERVICE_LOCK_FLM2	Second RSP/FLM ID may not service the lock
RC_ERR_CANT_SERVICE_LOCK_FLMBOTH	Neither RSP/FLM ID may service the lock
RC_ERR_ALREADY_HAS_ANOTHER_LOCK_OPEN_FLM1	flm1 has active service call and is an FLM type user
RC_ERR_ALREADY_HAS_ANOTHER_LOCK_OPEN_FLM2	flm2 has active service call and is an FLM type user
RC_ERR_FLM1_NOT_FOUND	RSP/FLM ID 1 not found in database
RC_ERR_FLM2_NOT_FOUND	RSP/FLM ID 2 not found in database
RC_ERR_FLMBOTH_NOT_FOUND	Both RSP/FLM ID not found in database
RC_ERR_FLMBOTH_BLANK	Both RSP/FLM ID are blank
RC_ERR_LOCK_DUALMODE_ONLY_ONE_FLM	Dual mode lock but 1 FLM entered
RC_ERR_FLM1_NOT_FIELD_ID	RSP/FLM ID 1 is not a field ID (i.e. ID is a Dispatcher, Supervisor, etc.)
RC_ERR_FLM2_NOT_FIELD_ID	RSP/FLM ID 2 is not a field ID (i.e. ID is a Dispatcher, Supervisor, etc.)
RC_ERR_FLM1_NOT_SAME_MODE_AS_LOCK	RSP/FLM ID 1 is not the same mode as the lock
RC_ERR_FLM2_NOT_SAME_MODE_AS_LOCK	RSP/FLM ID 2 is not the same mode as the lock
RC_ERR_DUAL_MODE_USER_TIME_WINDOW_MISMATCH	Dual mode - user time window mismatch (one user has time windows, one user does not)
RC_ERR_FLMBOTH_NOT_SAME_MODE_AS_LOCK	Dual mode - Both IDs are not the same mode as the lock
RC_ERR_FLM1_AND_FLM2_ARE_THE_SAME	Dual mode - the user IDs are the same
RC_ERR_FLMID_REGION_DOES_NOT_MATCH_LOCK_REGION	One or both users don't match lock region, and region control is active
RC_ERR_LOCK_DUALMODE_ONLY_ONE_FLM	Lock is dual mode but only 1 FLM entered

RC_ERR_NEW_FLM1_NOT_FOUND	Failed to find new first RSP/FLM I.D. record in user database table
RC_ERR_NEW_FLM2_NOT_FOUND	Failed to find new second RSP/FLM I.D. record in user database table
RC_ERR_NEW_FLMBOTH_NOT_FOUND	Failed to find either new RSP/FLM I.D. record in user database table
RC_ERR_NEW_FLMBOTH_BLANK	Both RSP/FLM I.D. are blank
RC_ERR_FAILED_INSERT_LOG_ENTRY	Log file could not be obtained
RC_ERR_FAILED_UPDATE_LOCK_ENTRY	Failed to update lock entry in lock table
RC_ERR_FAILED_UPDATE_LOG_ENTRY	Failed to update log entry for lock
RC_ERR_FAILED_UPDATE_FLM1	Failed to update first RSP/FLM I.D. record in user database table
RC_ERR_FAILED_UPDATE_FLM2	Failed to update second RSP/FLM I.D. record in user database table
RC_ERR_FAILED_UPDATE_NEW_FLM1	Failed to update new first RSP/FLM I.D. record in user database table
RC_ERR_FAILED_UPDATE_NEW_FLM2	Failed to update new second RSP/FLM I.D. record in user database table
RC_ERR_LOG_ENTRY_NOT_FOUND	Lock dispatch record not found in lock log database table
RC_ERR_ASSIGN_LOCK_NOT_UNASSIGNED	Failed to assign lock. Lock is open but not unassigned
RC_ERR_LOCK_ALREADY_UNASSIGNED	Lock is already unassigned
RC_ERR_FORCE_CLOSE_FAILED_NOT_SKIPPED_SEQUENCE	Failed to force close lock. Force close can only be applied to locks open on a skipped route sequence
RC_ERR_CLOSE_LOCK_TOO_MANY_ATTEMPTS	Lock has been attempted to be closed more than the authorized number of times. Insufficient authority for further attempts
RC_ERR_LOCK_OPEN_BUT_UNASSIGNED	Lock is open but unassigned to a user
RC_ERR_CLOSE_ROUTE_NO_SEAL	Lock on route does not have close seal
RC_ERR_CLOSE_LOCK_NO_SEAL	Failed to close lock. No close seal given for close
RC_ERR_CLOSE_LOCK_SEAL_MISMATCH	Seal numbers do not match for lock close
RC_ERR_FORCE_CLOSE_OF_LAST_ROUTE_LOCK_SEQ	Failed to force close route lock for sequence. Sequence is last combination issued to lock
RC_ERR_FAILED_DELETE_LOG_ENTRY	Failed to remove log record from lock log database table
RC_ERR_FAILED_INSERT_LOGHIST_ENTRY	Failed to insert log record into log history database table
RC_ERR_INVALID_GROUP_BLANK	Lock group name contains embedded blanks or is blank
RC_ERR_CHANGE_REGION_REGION_INVALID_DATA	Data for region being changed is not valid
RC_ERR_CHANGE_REGION_DOESNT_EXIST	Region being changed doesn't exist
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the lock's new region
RC_ERR_CUSTOMER_NOT_FOUND	Failed to find the customer in the database customer table. The customer ID is not in the database customer table
RC_ERR_INVALID_NEW_LOCKNAME	The new lock name is blank
RC_ERR_RENAME_LOCK_NEW_NAME_MODE_ALREADY_EXISTS	Another lock already exists with the new name and mode
RC_ERR_RENAME_FAILED_UPDATE_LOCK_FOR_RENAME	Failed to update the lock record for renaming lock
RC_ERR_RENAME_FAILED_UPDATE_LOG_FOR_RENAME	Failed to update the lock log entries for renaming open lock
RC_ERR_FAILED_OPEN_TABLE	Failed to open table. A database error occurred
RC_ERR_FAILED_GET_RECORD_COUNT	Failed to get record count for current table given search parameter. A database error occurred
RC_ERR_INVALID_ROUTE_NAME_BLANK	Invalid route name. Route name is blank
RC_ERR_FAILED_ADD_ROUTE_ALREADY_EXISTS	Failed to add route. Route name already exists
RC_ERR_REGION_INVALID_DATA	Data for region is not valid. Region is blank
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the route's region
RC_ERR_ROUTE_FAILED_INSERT	Failed to insert record into route table
RC_ERR_ROUTE_FAILED_UPDATE	Failed to update record in route table
RC_ERR_ROUTE_LOCK_FAILED_UPDATE	Failed to update record in route lock table
RC_ERR_ROUTE_LOCK_FAILED_INSERT	Failed to insert record into route lock table
RC_ERR_ROUTE_NOT_FOUND	Failed to find route name entry in route table
RC_ERR_ROUTE_FAILED_OPEN_ROUTE_LOCK_TABLE	Failed to open route lock table
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the route's new region
RC_ERR_ROUTE_FAILED_UPDATE	Failed to update record in route table
RC_ERR_ROUTE_FAILED_DELETE	Failed to delete record from route table
RC_ERR_INPUT_FILE_NO_ROUTE_LOCKS	The input transaction file does not contain any route locks
RC_ERR_INVALID_LOCKNAME	Invalid lock name. The lock name is blank
RC_ERR_FAILED_ADD_ROUTE_LOCK_ALREADY_EXISTS	Error adding route lock record. Route lock already exists
RC_ERR_LOCK_ROUTE_REGION_MISMATCH	Lock does not have the same region as the route

RC_ERR_ROUTE_NO_LOCKS_ASSIGNED	The route has no locks assigned to it
RC_ERR_INVALID_ROUTE_SUPPORT_SETTING	Invalid Route Support Setting
RC_ERR_ROUTE_LOCK_NOT_FOUND	Route lock not found in route lock table
RC_ERR_ROUTE_LOCK_FAILED_DELETE	Failed to delete record in route lock table
RC_ERR_DISPATCH_ROUTE_FAILED_READ_ROUTE_FILE	Failed to read route from file
RC_ERR_DISPATCH_ROUTE_FAILED_READ_ROUTE_DATABASE	Failed to read route from database
RC_ERR_DISPATCH_ROUTE_ALREADY_EXISTS_DIFF_REGION_CONTROL	Failed to dispatch route. The route name is already in use in a different region, and region control is active
RC_ERR_FILL_ROUTE_LOCK_LIST_SOME_LOCKS_FAILED	Fill route lock list some locks failed
RC_ERR_FILL_ROUTE_LOCK_LIST_ALL_LOCKS_FAILED	Fill route lock list all locks failed
RC_ERR_DISPATCH_ROUTE_FAILED_FLMS_LOCKS_ROUTE	Incompatibility or error encountered between locks and users for route from database
RC_ERR_DISPATCH_ROUTE_REGION_DOES_NOT_MATCH_LOCKS_REGION	Failed to dispatch route. The region assigned to the route does not match the region assigned to one or more of the locks on the route
RC_ERR_DISPATCH_ROUTE_SOME_LOCKS_FAILED	Not all locks were successfully dispatched
RC_ERR_DISPATCH_ROUTE_ALL_LOCKS_FAILED	No locks were successfully dispatched
RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED	Some locks were not reassigned
RC_ERR_REASSIGN_ROUTE_NONE_REASSIGNED	No locks were reassigned
RC_ERR_CLOSE_ROUTE_INVALID_FORCE_CLOSE	Invalid force close found in locks given for route close
RC_ERR_CLOSE_ROUTE_NOT_ALL_CLOSED	Errors closing some locks
RC_ERR_FAILED_RENAME_OLD_USER_ID_BLANK	Failed to rename user. The old user ID is blank
RC_ERR_FAILED_RENAME_NEW_USER_ID_BLANK	Failed to rename user. The new user ID is blank
RC_ERR_FAILED_RENAME_USER_ID_NOT_FOUND	Failed to rename user. The old user ID to be renamed was not found in the user table
RC_ERR_FAILED_RENAME_USER_NOT_SAME_REGION	Failed to rename user. The user's region does not match the dispatcher's region
RC_ERR_FAILED_RENAME_USER_ID_NEW_USER_ID_ALREADY_EXISTS	Failed to rename user. The new user ID already exists. A user can not be renamed to an already existing user ID
RC_ERR_FAILED_RENAME_USER_ID_IS_WINDOWS_LOGON_USER	Failed to rename user. The user is a Windows authentication logon user, and the user name must be the same as the Windows logon name to allow the user to be identified
RC_ERR_FAILED_RENAME_USER_ERROR_ENCRYPTING_NEW_PASSWORD	Failed to rename user. An error occurred while attempting to encrypt the new password for the user. The password contains invalid characters
RC_ERR_FAILED_RENAME_USER_ERROR_GENERATING_TEMP_USER_ID	Failed to rename user. Failed to generate a temporary user ID to associate with references to the old user while renaming the original user
RC_ERR_FAILED_RENAME_USER_ERROR_GENERATING_TEMP_USER_KEY	Failed to rename user. Failed to generate a temporary user Key SN to associate with references to the old user while renaming the original user
RC_ERR_FAILED_RENAME_USER_ERROR_INSERT_TEMP_USER	Failed to rename user. Failed to insert a temporary user to associate with references to the old user while renaming the original user
RC_ERR_FAILED_RENAME_USER_ERROR_INSERT_PWDHISTORY	Failed to rename user. A database error occurred while attempting to insert the old user record into the user history table
RC_ERR_FAILED_RENAME_USER_ERROR_INSERT_NEW_RECORD	Failed to rename user. A database error occurred while attempting to insert the new user record into the user table
RC_ERR_FAILED_RENAME_USER_ERROR_DELETE_TEMP_RECORD	Failed to rename user. Failed to delete the temporary user associated with references to the old user while renaming the original user
RC_ERR_INVALID_PWD_REC_USER_ID	Invalid user record. The User ID has not been set
RC_ERR_USER_NOT_FOUND	User not found in user database
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_USER_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the user's region
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_USER_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the user's new region
RC_ERR_BANK_BRANCH_NAME_INVALID_DATA	Data for bank branch name is not valid
RC_ERR_BANK_BRANCH_DOESNT_EXIST	Bank branch doesn't exist in the database
RC_ERR_INVALID_CUSTOMERID_BLANK	Invalid customer ID Customer ID is blank
RC_ERR_FAILED_UPDATE_CUSTOMER_ENTRY	Failed to update customer entry in customer table
RC_ERR_FAILED_ADD_CUSTOMER_ID_ALREADY_EXISTS	Failed to add/rename customer. The requested customer ID already exists
RC_ERR_FAILED_ADD_CUSTOMER_ERROR_INSERT_CUSTOMER_TABLE	Failed to add new customer. A database error occurred while inserting the new customer record into the customer table
RC_ERR_FAILED_RENAME_CUSTOMER_ERROR_LOCK_TABLE	Failed to rename customer. A database error occurred while changing the original customer ID references in the lock table

RC_ERR_FAILED_RENAME_CUSTOMER_ERROR_LOG_TABLE	Failed to rename customer. A database error occurred while changing the original customer ID references in the log table
RC_ERR_FAILED_RENAME_CUSTOMER_ERROR_BANK_BRANCH_TABLE	Failed to rename customer. A database error occurred while changing the original customer ID references in the bank branch table
RC_ERR_FAILED_RENAME_CUSTOMER_ERROR_ROUTE_TABLE	Failed to rename customer. A database error occurred while changing the original customer ID references in the route table
RC_ERR_FAILED_UPDATE_CUSTOMER_ENTRY	Failed to update customer entry in customer table
RC_ERR_FAILED_ADD_CUSTOMER_ALREADY_EXISTS	Failed to add customer. The customer ID already exists
RC_ERR_DELETE_CUSTOMER_FAILED_TO_GET_COUNT_USERS_WITH_CUSTOMER	Failed to delete customer. Failed to get count of users, locks, routes, and/or bank branches assigned to the customer
RC_ERR_DELETE_CUSTOMER_STILL_HAS_ASSIGNED_USERS	The selected customer may not be deleted because it is assigned to a user, lock, route, and/or bank branch
RC_ERR_FAILED_DELETE_CUSTOMER_ENTRY	Failed to delete the customer entry from the database customer table. A database error occurred while deleting the customer record
RC_ERR_FAILED_RENAME_BANK_BRANCH_NEW_NAME_ALREADY_EXISTS	Failed to rename bank branch! The new bank branch name already exists in the bank branch table.
RC_ERR_FAILED_RENAME_BANK_BRANCH_FAILED_FIND_ORIGINAL_RECORD	Failed to rename bank branch! Failed to find the original bank branch name in the bank branch table.
RC_ERR_FAILED_RENAME_BANK_BRANCH_FAILED_INSERT_NEW_RECORD	Failed to rename bank branch! A database error occurred while inserting the new bank branch record into the bank branch table.
RC_ERR_FAILED_RENAME_BANK_BRANCH_ERROR_LOCK_TABLE	Failed to rename bank branch! A database error occurred while changing the original bank branch references in the lock table.
RC_ERR_FAILED_RENAME_BANK_BRANCH_ERROR_PWD_TABLE	Failed to rename bank branch! A database error occurred while changing the original bank branch references in the user table.
RC_ERR_FAILED_RENAME_BANK_BRANCH_ERROR_DELETE_OLD_RECORD	Failed to rename bank branch! Failed to delete the original bank branch record from the bank branch table.
RC_ERR_ACTIVATE_LOCK_BANK_INSUFFICIENT_USERS_SET	Failed to activate bank mode lock! The bank mode lock does not have enough users set up for access to the lock.
RC_ERR_SHELVES_LOCK_NO_DISPATCH_MODE_FOR_LOCK	Failed to shelve locks! The Open Mode is not one of the modes being shelved for at least one of the specified lock serial numbers.
RC_ERR_ACTIVATE_LOCK_NO_DISPATCH_MODE_FOR_LOCK	Failed to activate locks! One or more modes of a lock did not have one of the modes set for dispatch to activate the lock.
RC_ERR_FAILED_DELETE_LOCK_INSERT_INTO_HISTORY_TABLE	Failed to delete shelved lock! A database error occurred while inserting the lock into the lock history table.
RC_ERR_SHELVES_LOCK_FAILED_DELETE_BANK_USERS	Failed to shelve lock! A database error occurred while deleting the bank mode users for the lock from the user lock table.
RC_ERR_LOCK_BANK_BRANCH_NAME_NOT_FOUND	Failed to find bank branch name for lock! The bank branch name does not exist in the bank branch table. Unable to determine bank branch ID.
RC_ERR_FAILED_ADD_USERS_INVALID_LOCK_MODE	Failed to add users to the lock! An invalid lock mode was encountered.
RC_ERR_FAILED_REMOVE_USERS_INVALID_LOCK_MODE	Failed to remove users from the lock! An invalid lock mode was encountered.
RC_ERR_ADD_USERS_LOCKS_ALL_PROCESSED_NO_USERS_ADDED	All locks processed in list but no locks had users added
RC_ERR_REMOVE_USERS_LOCKS_ALL_PROCESSED_NO_USERS_REMOVED	All locks processed in list but no locks had users removed
RC_ERR_ADD_USERS_LOCKS_SOME_NO_USERS_ADDED	Some locks did not have users added in the list
RC_ERR_REMOVE_USERS_LOCKS_SOME_NO_USERS_REMOVED	Some locks did not have users removed in the list.
RC_ERR_FAILED_ADD_USERS_LOCKS_NONE_SPECIFIED_TO_ADD	Failed to add users to the lock! No users are specified to add to the lock.
RC_ERR_FAILED_REMOVE_USERS_LOCKS_NONE_SPECIFIED_TO_REMOVE	Failed to remove users from the lock! No users are specified to remove from the lock.
RC_ERR_ADD_USERS_LOCKS_DATA_CORRUPT	Failed to add users to the lock! Data passed for adding users to the lock is corrupt or invalid.
RC_ERR_ADD_USERS_LOCKS_LOCK_DOES_NOT_EXIST	Failed to add users to the lock! Lock does not exist.
RC_ERR_ADD_USERS_LOCKS_LOCK_NOT_ACTIVE	Failed to add users to the lock! Lock is not active.
RC_ERR_ADD_USERS_LOCKS_NOT_AUTHORIZED_LOCK_REGION	Failed to add users to the lock! The current authorization does not have access to locks in other regions.
RC_ERR_ADD_USERS_LOCKS_FAILED_TO_GET_LOCK_CURRENT_USERS	Failed to add users to the lock! Failed to get the current users for the lock.
RC_ERR_REMOVE_USERS_LOCKS_DATA_CORRUPT	Failed to remove users from the lock! Data passed for removing users from the lock is corrupt or invalid.
RC_ERR_REMOVE_USERS_LOCKS_LOCK_DOES_NOT_EXIST	Failed to remove users from the lock! Lock does not exist.

RC_ERR_REMOVE_USERS_LOCKS_LOCK_NOT_ACTIVE	Failed to remove users from the lock! Lock is not active.
RC_ERR_REMOVE_USERS_LOCKS_NOT_AUTHORIZED_LOCK_REGION	Failed to remove users from the lock! The current authorization does not have access to locks in other regions.
RC_ERR_REMOVE_USERS_LOCKS_FAILED_TO_GET_LOCK_CURRENT_USERS	Failed to remove users from the lock! Failed to get the current users for the lock.
RC_ERR_ACTIVATE_LOCK_BANK_TOO_MANY_USERS_SET	Failed to activate bank mode lock! Too many users have been set up for access to the lock.
RC_ERR_ADD_USERS_LOCKS_USER_ALREADY_ASSIGNED_TO_LOCK	Failed to add users to the lock! User being added is already assigned to the lock.
RC_ERR_ADD_USERS_LOCKS_TOO_MANY_USERS	Failed to add users to the lock! Too many users are being assigned to the lock.
RC_ERR_ADD_USERS_LOCKS_NOT_SAME_BANK_BRANCH	Failed to add users to the lock! The user's bank branch name does not match the lock bank branch name.
RC_ERR_FAILED_GET_DISPATCHER_REGION	Failed to get assigned region for dispatcher authorization!
RC_ERR_ADD_USERS_LOCKS_NOT_SAME_REGION	Failed to add users to the lock! The user's region does not match the lock's region.
RC_ERR_ADD_USERS_LOCKS_BANK_BRANCH_NAME_NOT_SET	Failed to add users to the lock! The lock bank branch name is not set.
RC_ERR_ADD_USERS_LOCKS_BANK_NO_USERS_SET	Failed to add users to the lock! No users have been set to add to the lock.
RC_ERR_FAILED_ADD_USERS_NO_KEY_FOUND_IN_READER	Failed to add users to the lock! Unable to locate a key in the key reader. A supervisor audit key is needed.
RC_ERR_FAILED_ADD_USERS_INCORRECT_KEY_TYPE	Failed to add users to the lock! The key in the key reader is not the correct type of key. A supervisor audit key is needed.
RC_ERR_FAILED_REMOVE_USERS_NO_KEY_FOUND_IN_READER	Failed to remove users from the lock! Unable to locate a key in the key reader. A supervisor audit key is needed.
RC_ERR_FAILED_REMOVE_USERS_INCORRECT_KEY_TYPE	Failed to remove users from the lock! The key in the key reader is not the correct type of key. A supervisor audit key is needed.
RC_ERR_REMOVE_USERS_LOCKS_USER_NOT_ASSIGNED_TO_LOCK	Failed to remove users from the lock! The user being removed is not assigned to the lock.
RC_ERR_REMOVE_USERS_LOCKS_TOO_FEW_USERS_REMAINING	Failed to remove users from the lock! The lock will have too few users remaining at the lock if the specified users are removed.
RC_ERR_REMOVE_USERS_LOCKS_BANK_BRANCH_NAME_NOT_SET	Failed to remove users from the lock! The lock bank branch name is not set.
RC_ERR_REMOVE_USERS_LOCKS_BANK_NO_USERS_SET	Failed to remove users from the lock! No users have been set to remove from the lock.
RC_ERR_FAILED_DELETE_USER_LOCK_ENTRY	Failed to delete user lock entry for bank mode user assigned to lock! A database error occurred while deleting the user lock entry.
RC_ERR_ACTIVATE_LOCK_BANK_USER_NOT_SAME_REGION	Failed to activate bank mode lock! The bank mode user's region does not match the lock's region.
RC_ERR_ADD_USERS_LOCKS_NOT_BANK_MODE_USER	Failed to add users to the lock! The lock user being added is not a bank mode user.
RC_ERR_ACTIVATE_LOCK_NOT_BANK_MODE_USER	Failed to activate bank mode lock! The lock user being added for lock activation is not a bank mode user.
RC_ERR_FORCE_DELETE_LOCK_FAILED_DELETE_BANK_USERS	Failed to shelve lock! A database error occurred while deleting the bank mode users for the lock from the user lock table.
RC_ERR_FAILED_RENAME_USER_NOT_SAME_REGION	Failed to rename user! The user's region does not match the dispatcher's region.
RC_ERR_INVALID_USER_LOCK_HISTORY_DATE_VALUE	Invalid user lock history record for bank mode users. The date value is not set.
RC_ERR_FAILED_ADD_CUSTOMER_ALREADY_EXISTS	Failed to add customer! The customer ID already exists!
RC_ERR_INVALID_LOCK_REC_LOCKNAME	Invalid lock record. The lock name is blank or contains unprintable characters.
RC_ERR_INVALID_LOCK_REC_SERIALNUM	Invalid lock record. The lock serial number is not set.
RC_ERR_INVALID_LOCK_REC_LOCKMODE	Invalid lock record. The lock mode is not set to either FLM, Route, or Bank mode.
RC_ERR_INVALID_LOCK_REC_RECTYPE	Invalid lock record. The lock record type is not set to either active, being installed, pending shelve, shelved, or being replaced.
RC_ERR_INVALID_LOCK_REC_FLM_ROUTE	Invalid lock record. The lock record indicates an flm lock set for route dispatch.
RC_ERR_INVALID_LOCK_REC_SLMCALL_ROUTE	Invalid lock record. The lock record indicates a route lock set for second line maint call.
RC_ERR_INVALID_LOCK_REC_UNASSIGNEDCALL	Invalid lock record. The lock record indicates an invalid unassigned call.
RC_ERR_INVALID_LOCK_REC_OPENS_ROUTEISS	Invalid lock record. The lock record indicates an invalid single open with route dispatch.
RC_ERR_FAILED_ADD_USER_CUSTOMER_ID_DOES_NOT_EXIST	Failed to add user. The customer ID specified for the user does not exist in the customer table.

RC_ERR_FAILED_ADD_USER_BANK_BRANCH_DOES_NOT_EXIST	Failed to add user. The bank branch name specified for the user does not exist in the bank branch table.
RC_ERR_FAILED_ADD_USER_BANK_MODE_USER_ID_FOR_BRANCH_ALREADY_EXISTS	Failed to add user. The bank mode user ID and bank branch name specified for the user already exists.
RC_ERR_ROLE_DELETE_FAILED_ROLE_IN_USE	Can't delete role - users are assigned to it
RC_ERR_DELETE_CUSTOMER_FAILED_TO_GET_COUNT_USERS_WITH_CUSTOMER	Failed to delete customer. Failed to get count of users/locks/routes/bank branches still assigned to customer.
RC_ERR_DELETE_CUSTOMER_STILL_HAS_ASSIGNED_USERS	Customer being deleted still has assigned users/locks/routes/bank branches.
RC_ERR_FAILED_RENAME_USER_ID_IS_WINDOWS_LOGON_USER	Failed to rename user. The user is a Windows authentication logon user, and the user name must be the same as the Windows logon name to allow the user to be identified.
RC_ERR_FAILED_RENAME_USER_ERROR_GENERATING_TEMP_USER_ID	Failed to rename user. Failed to generate a temporary user ID to associate with references to the old user while renaming the original user.
RC_ERR_FAILED_RENAME_USER_ERROR_GENERATING_TEMP_USER_KEY	Failed to rename user. Failed to generate a temporary user Key SN to associate with references to the old user while renaming the original user.
RC_ERR_FAILED_RENAME_USER_ERROR_INSERT_TEMP_USER	Failed to rename user. Failed to insert a temporary user to associate with references to the old user while renaming the original user.
RC_ERR_FAILED_RENAME_USER_ERROR_DELETE_TEMP_RECORD	Failed to rename user. Failed to delete the temporary user associated with references to the old user while renaming the original user.
RC_ERR_DELETE_LOCK_FAILED_DELETE_COLLECTION_LOCK_ENTRIES	Failed to delete lock. A database error occurred while removing entries for the lock from the collection lock table.
RC_ERR_INVALID_CUSTOMERID_BLANK	Invalid customer ID. Customer ID is blank.
RC_ERR_FAILED_OPEN_TABLE	Failed to open table. A database error occurred.
RC_ERR_FAILED_GET_RECORD_COUNT	Failed to get record count for current table given search parameter. A database error occurred.
RC_ERR_DISPATCHER_NOT_FOUND	Failed to find the dispatcher or logon user in the database user table! The dispatcher ID is not in the database user table.
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the lock's region.
RC_ERR_FLM1_BLANK	First RSP/FLM ID is blank
RC_ERR_FLM2_BLANK	Second RSP/FLM ID is blank
RC_ERR_LOCK_INVALID_SEQ	Lock route sequence number is out of range.
RC_ERR_FORCE_CLOSE_FAILED_NOT_SKIPPED_SEQUENCE	Failed to force close lock. Force close can only be applied to locks open on a skipped route sequence.
RC_ERR_INVALID_GROUP_BLANK	Lock group name contains embedded blanks or is blank.
RC_ERR_INVALID_GROUP_NUMBER_CHARACTERS	Lock group name does not contain 2, 4, or 6 characters
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the lock's new region.
RC_ERR_INVALID_NEW_LOCKNAME	The new lock name is blank.
RC_ERR_FAILED_RENAME_OLD_USER_ID_BLANK	Failed to rename user. The old user ID is blank.
RC_ERR_FAILED_RENAME_NEW_USER_ID_BLANK	Failed to rename user. The new user ID is blank.
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_USER_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the user's region.
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_USER_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the user's new region.
RC_ERR_BANK_BRANCH_NAME_INVALID_DATA	Data for bank branch name is not valid.
RC_ERR_BANK_BRANCH_DOESNT_EXIST	Bank branch doesn't exist in the database.
RC_ERR_INVALID_ROUTE_NAME_BLANK	Invalid route name. Route name is blank.
RC_ERR_FAILED_ADD_ROUTE_ALREADY_EXISTS	Failed to add route! Route name already exists
RC_ERR_REGION_INVALID_DATA	Data for region is not valid. Region is blank.
RC_ERR_REGION_DOESNT_EXIST	Region does not exist in the database.
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the route's region.
RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_NEW_REGION	Dispatcher belongs to a local region. The dispatcher's region does not match the route's new region.
RC_ERR_INPUT_FILE_NO_ROUTE_LOCKS	The input transaction file does not contain any route locks.
RC_ERR_INVALID_LOCKNAME	Invalid lock name. The lock name is blank.
RC_ERR_FAILED_ADD_ROUTE_LOCK_ALREADY_EXISTS	Error adding route lock record. Route lock already exists.

RC_ERR_LOCK_ROUTE_REGION_MISMATCH	Lock does not have the same region as the route.
RC_PARTIAL_OK	Partial Success
RC_NOT_OK	Failure
RC_ERR_ROUTE_LOCK_NOT_FOUND	Route lock not found in route lock table
RC_ERR_ROUTE_LOCK_FAILED_DELETE	Failed to delete record in route lock table
RC_ERR_INVALID_ROUTE_SUPPORT_SETTING	Invalid Route Support Setting.
RC_ERR_CLOSE_ROUTE_INVALID_FORCE_CLOSE	Invalid force close found in locks given for route close.
RC_ERR_FAILED_VALIDATE_FILE	Failed to validate file against the given XML schema.
RC_ERR_UNABLE_TO_ACTIVATE_GEN2_LOCK_LEGACY_PCIO	Unable to activate Cencon Gen 2 locks with serial numbers above 999999 using a legacy Cencon PCIO device. A Cencon USB Key Box is needed.
RC_ERR_UNABLE_TO_SHELVES_GEN2_LOCK_LEGACY_PCIO	Unable to shelve Cencon Gen 2 locks that have been fully activated with Gen 2 security data using a legacy Cencon PCIO device. A Cencon USB Key Box is needed.
RC_ERR_UNABLE_TO_ADD_DELETE_USERS_GEN2_LOCK_LEGACY_PCIO	Unable to add users to or delete users from Cencon Gen 2 locks that have been fully activated with Gen 2 security data using a legacy Cencon PCIO device. A Cencon USB Key Box is needed.
RC_ERR_FAILED_TO_GET_SYSTEM_NETWORK_ADDRESS_INFORMATION	Failed to get the host system network address information!
RC_ERR_FAILED_TO_DECRYPT_DATA	Failed to decrypt data! The data may have been corrupted, or the Cencon USB Key Box encryption data may be in error.
RC_ERR_FAILED_TO_ENCRYPT_DATA	Failed to encrypt data! The data may have been corrupted, or the Cencon USB Key Box encryption data may be in error.
RC_ERR_DISPATCH_ROUTE_FAILED_READ_ROUTE_DATABASE	Failed to read route from database.
RC_ERR_READ_SAKEY_INIT_ADD_INVALID_DATA_NUMBER_USERS	Failed to read bank mode activate / add users key entry! An invalid number of bank mode users was indicated on the key.
RC_ERR_READ_SAKEY_INVALID_DATA_DID_NOT_VALIDATE	Data read from SA key did not validate! The data is invalid, corrupt, or has been tampered with.
RC_ERR_RETRIEVE_BANK_USERS_INVALID_KEY	The key was not initialized for retrieving bank users.
RC_ERR_RETRIEVE_BANK_USERS_KEY_NOT_USED	The key was initialized for retrieving bank users but does not contain any user info.
RC_ERR_GEN2_UPDATE_ACTIVATE_LOCK_NOT_ACTIVE	The Gen 2 lock being updated from Gen 1 to Gen 2 activation is not an active lock.
RC_ERR_GEN2_UPDATE_ACTIVATE_NOT_GEN2_LOCK	The Gen 2 lock being updated from Gen 1 to Gen 2 activation is not a Gen 2 lock.
RC_ERR_GEN2_UPDATE_ACTIVATE_ALREADY_ACTIVATED_AS_GEN2	The Gen 2 lock being updated from Gen 1 to Gen 2 activation has already been activated as a Gen 2 lock.
RC_ERR_GEN2_UPDATE_ACTIVATE_LOCK_FAILED_INSERT_INTO_HISTORY_TABLE	The Gen 2 lock being updated from Gen 1 to Gen 2 activation failed to insert into the lock history table.
RC_ERR_GEN2_UPDATE_ACTIVATE_LOCK_FAILED_INSERT_INTO_USER_LOCK_HISTORY_TABLE	The Gen 2 lock being updated from Gen 1 to Gen 2 activation failed to insert users into the user lock history table.
RC_ERR_GEN2_UPDATE_ACTIVATE_IS_DISPATCHED_MUST_BE_CLOSED	The Gen 2 lock being updated from Gen 1 to Gen 2 activation is dispatched. The lock needs to be closed to update the activation.
RC_ERR_GEN2_LOCK_NOT_SUPPORTED_BY_CURRENT_PCIO_DEVICE	The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_BANK_USER_ID_OUT_OF_RANGE_FOR_GEN1_LOCK	The assigned bank user ID for the user being added is out of range for a Cencon Gen 1 lock. The Cencon Gen 1 lock can support a range of 01 - 79 for bank mode user ids.
RC_ERR_GEN2_LOCK_PCIO_SUPPORT_NOT_AVAILABLE_HIGHER_BANK_USER_IDS	The current Cencon PCIO device does not support the Cencon Gen 2 lock wider range of bank user IDs. The Cencon Gen 1 lock can support a range of 01 - 79 for bank mode user ids.
RC_ERR_WRITING_CLOCK_SET_HEADER	Error writing the 1922 Clock Set Key header data.
RC_ERR_READ_USER_KEY_INVALID_DATA_DID_NOT_VALIDATE	Data read from user key did not validate! The data is invalid, corrupt, or has been tampered with.
RC_ERR_READ_USER_KEY_INVALID_DATA_DID_NOT_VALIDATE_AUDITS	Data read from user key audits did not validate! The audit data is invalid, corrupt, or has been tampered with.
RC_ERR_READ_USER_KEY_INVALID_DATA_AUDITS_BAD_CRC	Data read from user key audits is corrupt! The audit data is invalid, corrupt, or has been tampered with.
RC_ERR_DISPATCH_LOCK_RESYNC_IN_PROGRESS	Failed to dispatch lock! The lock is currently being resynchronized with the PC. You will need to complete or cancel the resynchronization operation before doing dispatching the lock.
RC_ERR_ACTIVATE_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to activate lock by serial connection! The indicated lock serial number to activate is not a Cencon Gen 2 lock.

RC_ERR_ACTIVATE_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to activate lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_ACTIVATE_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to activate lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_ACTIVATE_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to activate lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_ACTIVATE_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_ACTIVATED	Failed to activate lock by serial connection! The connected lock is not the one expected for activation. A different lock is connected than the serial number set up to be activated.
RC_ERR_SHELVING_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to shelve lock by serial connection! The indicated lock serial number to shelve is not a Cencon Gen 2 lock.
RC_ERR_SHELVING_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to shelve lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_SHELVING_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to shelve lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_SHELVING_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to shelve lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_SHELVING_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_SHELVED	Failed to shelve lock by serial connection! The connected lock is not the one expected for being shelved. A different lock is connected than the serial number set up to be shelved.
RC_ERR_ADD_USERS_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to add users to lock by serial connection! The indicated lock serial number to shelve is not a Cencon Gen 2 lock.
RC_ERR_ADD_USERS_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to add users to lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_ADD_USERS_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to add users to lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_ADD_USERS_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to add users to lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_ADD_USERS_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK	Failed to add users to lock by serial connection! The connected lock is not the one expected for having users added. A different lock is connected than the serial number set up to have users added.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to remove users from lock by serial connection! The indicated lock serial number to shelve is not a Cencon Gen 2 lock.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to remove users from lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to remove users from lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to remove users from lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK	Failed to remove users from lock by serial connection! The connected lock is not the one expected for having users removed. A different lock is connected than the serial number set up to have users removed.
RC_ERR_ADD_USERS_LOCK_SERIAL_OPERATION_FAILED_AT_LOCK	Failed to add users to lock by serial connection! All of the add user operations failed at the lock.
RC_ERR_REMOVE_USERS_LOCK_SERIAL_OPERATION_FAILED_AT_LOCK	Failed to remove users from lock by serial connection! All of the remove user operations failed at the lock.
RC_ERR_FAILED_DELETE_ASSIGNED_TO_BANK_LOCK	User cannot be deleted from password table. User is assigned to bank lock(s).
RC_ERR_SET_TZDSTTABLE_LOCK_DATA_CORRUPT	Failed to set time zone / daylight savings time transition table at lock by serial connection! Data given for lock to be updated is corrupt or invalid.
RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to set time zone / daylight savings time transition table at lock by serial connection! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to set time zone / daylight savings time transition table at lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.

RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to set time zone / daylight savings time transition table at lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to set time zone / daylight savings time transition table at lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_UPDATED	Failed to set time zone / daylight savings time transition table at lock by serial connection! The connected lock is not the one expected to be updated. A different lock is connected than the serial number set up to update the TZ/DST table.
RC_ERR_SET_ACCESS_LOCK_DATA_CORRUPT	Failed to set access configuration at lock by serial connection! Data given for lock to be updated is corrupt or invalid.
RC_ERR_SET_ACCESS_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to set access configuration at lock by serial connection! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_SET_ACCESS_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to set access configuration at lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_SET_ACCESS_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to set access configuration at lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_SET_ACCESS_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to set access configuration at lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_SET_ACCESS_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_UPDATED	Failed to set access configuration at lock by serial connection! The connected lock is not the one expected to be updated. A different lock is connected than the serial number set up to update the access configuration.
RC_ERR_SET_ACCESS_LOCK_SERIAL_LOCK_IS_DISPATCHED	Failed to set access configuration at lock by serial connection! The lock is currently dispatched in the Cencon database. Changing between single and dual mode will invalidate the dispatch. Close the dispatched call to the lock first.
RC_ERR_SET_OPEN_DELAY_LOCK_DATA_CORRUPT	Failed to set open delay and window duration at lock by serial connection! Data given for lock to be updated is corrupt or invalid.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to set open delay and window duration at lock by serial connection! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to set open delay and window duration at lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to set open delay and window duration at lock by serial connection! The lock is not responding across the serial connection.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to set open delay and window duration at lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_UPDATED	Failed to set open delay and window duration at lock by serial connection! The connected lock is not the one expected to be updated. A different lock is connected than the serial number set up to update the open delay and window duration.
RC_ERR_SHELVE_LOCK_ALREADY_SHELVED	Failed to shelve lock! The lock is already shelved.
RC_ERR_FORCE_SHELVE_OPEN_LOCK_FAILED_FIND_FLM1	Failed to force shelve of open lock! Failed to find user 1 from active log record.
RC_ERR_FORCE_SHELVE_OPEN_LOCK_FAILED_UPDATE_FLM1	Failed to force shelve of open lock! Failed to update user 1 from active log record.
RC_ERR_FORCE_SHELVE_OPEN_LOCK_FAILED_FIND_FLM2	Failed to force shelve of open lock! Failed to find user 2 from active log record.
RC_ERR_FORCE_SHELVE_OPEN_LOCK_FAILED_UPDATE_FLM2	Failed to force shelve of open lock! Failed to update user 2 from active log record.
RC_ERR_FORCE_SHELVE_LOCK_FAILED_CLOSE_OUT_LOCK	Failed to force shelve of open lock! Failed to close out lock.
RC_ERR_SET_ACCESS_LOCK_SERIAL_FAILED_UPDATE_LOCK_IN_DATABASE	Failed to set access configuration at lock by serial connection! Failed to update lock record in Cencon database.
RC_ERR_SET_OPEN_DELAY_LOCK_SERIAL_FAILED_UPDATE_LOCK_IN_DATABASE	Failed to set open delay and window duration at lock by serial connection! Failed to update lock record in Cencon database.
RC_ERR_RESYNC_DISPATCHING_LOCK_DATA_CORRUPT	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! Data given for lock to be updated is corrupt or invalid.

RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The lock is not responding across the serial connection.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_UPDATE	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The connected lock is not the one expected to be updated. A different lock is connected than the serial number set up to resynchronize dispatching with.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_LOCK_IS_DISPATCHED	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The lock is dispatched in the database. Resynchronizing the dispatching while a call is dispatched will invalidate the dispatched call.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_LOCK_IS_NOT_ACTIVATED_AS_GEN2	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The lock is not activated as a Cencon Gen 2 lock. It is activated in compatibility mode for Gen 1, or is not a Gen 2 lock.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_LOCK_IS_NOT_ACTIVE_IN_DATABASE	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The lock is not active (shelved) in the Cencon database.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_FAILED_UPDATE_LOCK_IN_DATABASE	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! Failed to update lock record in Cencon database.
RC_ERR_READ_USER_KEY_INVALID_DATA_TIME_WINDOWS_BAD_CRC	Data read from user key time window configuration is corrupt! The user key time window data is invalid, corrupt, or has been tampered with.
RC_ERR_RESYNC_BANK_USERS_LOCK_DATA_CORRUPT	Failed to resynchronize bank mode user table of Cencon database lock entry! Data given for lock to be updated is corrupt or invalid.
RC_ERR_RESYNC_BANK_USERS_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to resynchronize bank mode user table of Cencon database lock entry! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_RESYNC_BANK_USERS_LOCK_SERIAL_LOCK_IS_NOT_ACTIVATED_AS_GEN2	Failed to resynchronize bank mode user table of Cencon database lock entry! The lock is not activated as a Cencon Gen 2 lock. It is activated in compatibility mode for Gen 1, or is not a Gen 2 lock.
RC_ERR_RESYNC_BANK_USERS_LOCK_SERIAL_LOCK_IS_NOT_ACTIVE_IN_DATABASE	Failed to resynchronize bank mode user table of Cencon database lock entry! The lock is not active (shelved) in the Cencon database.
RC_ERR_RESYNC_BANK_USERS_LOCK_SERIAL_LOCK_FAILED_READ_CURRENT_BANK_USERS	Failed to resynchronize bank mode user table of Cencon database lock entry! An error occurred trying to read the current user table for the bank mode lock from the Cencon database.
RC_ERR_RESYNC_BANK_USERS_LOCK_SERIAL_LOCK_FAILED_READ_USERS_FOR_LOCK	Failed to resynchronize bank mode user table of Cencon database lock entry! An error occurred trying to look up data from the Cencon database on the users read from the lock.
RC_ERR_FAILED_FIND_BANK_MODE_USER	Failed to find bank mode user in Cencon database.
RC_ERR_USER_FOUND_IS_NOT_BANK_MODE_USER	Failed to find bank mode user. The matching user found is not a bank mode user.
RC_ERR_CLOSE_LOCK_DATA_CORRUPT	Failed to close dispatched call to Cencon lock by serial connection! Data given for lock to be closed is corrupt or invalid.
RC_ERR_CLOSE_LOCK_SERIAL_NOT_GEN_2_LOCK	Failed to close dispatched call to Cencon lock by serial connection! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_CLOSE_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to close dispatched call to Cencon lock by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_NOT_RESPONDING	Failed to close dispatched call to Cencon lock by serial connection! The lock is not responding across the serial connection.

RC_ERR_CLOSE_LOCK_SERIAL_FAILED_TO_GET_SERIAL_NUMBER	Failed to close dispatched call to Cencon lock by serial connection! Failed to get the lock serial number from across the serial connection.
RC_ERR_CLOSE_LOCK_SERIAL_CONNECTED_LOCK_DOESNT_MATCH_LOCK_TO_BE_CLOSED	Failed to close dispatched call to Cencon lock by serial connection! The connected lock is not the one expected to be closed. A different lock is connected than the serial number set up to be closed.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_IS_NOT_DISPATCHED	Failed to close dispatched call to Cencon lock by serial connection! The lock is not currently dispatched in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_DISPATCHED_CALL_NOT_OPENED_LOCK_YET	Failed to close dispatched call to Cencon lock by serial connection! The call dispatched to open the lock has not been used to open the lock yet.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_BOLT_RETRACTED	Failed to close dispatched call to Cencon lock by serial connection! The lock bolt is currently retracted.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_MODE_NOT_ACTIVE	Failed to close dispatched call to Cencon lock by serial connection! The lock mode being closed is not active on the lock.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_MODE_DUAL_ACCESS_SETTING_MISMATCH	Failed to close dispatched call to Cencon lock by serial connection! The lock single/dual user access configuration is mismatched with the Cencon database lock entry.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_DOOR_SENSOR_INDICATES_CONTAINER_OPEN	Failed to close dispatched call to Cencon lock by serial connection! The connected door sensor indicates the container door is open.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_CHANGE_KEY_INSERTED	Failed to close dispatched call to Cencon lock by serial connection! The change key is inserted in the back of the lock.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_SEAL_COUNT_BEHIND_HOST_SYSTEM	Failed to close dispatched call to Cencon lock by serial connection! The lock seal count is behind the host system. The Cencon database and the lock are out of synchronization for dispatching.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_SEAL_COUNT_AHEAD_OF_HOST_SYSTEM	Failed to close dispatched call to Cencon lock by serial connection! The lock seal count is ahead the host system. The Cencon database and the lock are out of synchronization for dispatching.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_FAILED_OPEN_QUERY_LOG_TABLE	Failed to close dispatched call to Cencon lock by serial connection! Failed to open query of the active lock log table for dispatches to the lock being closed.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_NO_ACTIVE_LOG_RECORDS_FOUND_FOR_DISPATCH	Failed to close dispatched call to Cencon lock by serial connection! No active lock log records for dispatches to the lock being closed were found. There is possible data corruption with the Cencon database active log table data.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_TOO_MANY_ACTIVE_LOG_RECORDS_FOUND_FOR_DISPATCH	Failed to close dispatched call to Cencon lock by serial connection! Too many active lock log records for dispatches to the lock being closed were found. There is possible data corruption with the Cencon database active log table data.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_TOO_FEW_ACTIVE_LOG_RECORDS_FOUND_FOR_DISPATCH	Failed to close dispatched call to Cencon lock by serial connection! Too few active lock log records for dispatches to the lock being closed were found. There is possible data corruption with the Cencon database active log table data.
RC_ERR_CLOSE_LOCK_SERIAL_OPENING_FLM1_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the first user who opened the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_OPENING_FLMBOTH_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find both users who opened the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_OPENING_FLM2_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the second user who opened the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_DISPATCHED_FLM1_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the first user who was dispatched to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_DISPATCHED_FLMBOTH_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find both users who were dispatched to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_DISPATCHED_FLM2_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the second user who was dispatched to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_USER_DISPATCHED_DOESNT_MATCH_USER_OPENED	Failed to close dispatched call to Cencon lock by serial connection! The user(s) who opened the lock do not match the users dispatched to the lock.

RC_ERR_CLOSE_LOCK_SERIAL_ROUTE_DISPATCHED_FLM1_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the first user who was dispatched on a route to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_ROUTE_DISPATCHED_FLMBOTH_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find both users who were dispatched on a route to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_ROUTE_DISPATCHED_FLM2_NOT_FOUND	Failed to close dispatched call to Cencon lock by serial connection! Failed to find the second user who was dispatched on a route to the lock in the Cencon database.
RC_ERR_CLOSE_LOCK_SERIAL_ROUTE_USER_DISPATCHED_DOESNT_MATCH_USER_OPENED	Failed to close dispatched call to Cencon lock by serial connection! The user(s) who opened the lock do not match the users dispatched on a route to the lock.
RC_ERR_IMPORT_FAILED_SYSTEM_CHECK	The import lock XML file's system identifier does not match the current system. The locks cannot be imported.
RC_ERR_FAILED_UPDATE_LOCK_NETWORK_ADDRESS	Failed to update the network address for all modes of the lock serial number! A database error occurred.
RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT_NAME_NOT_SET	Failed to activate lock! The lock name has not been set.
RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT_MODE_NOT_SET	Failed to activate lock! The lock mode has not been set.
RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT_SERIALNUM_NOT_SET	Failed to activate lock! The lock serial number has not been set, or is out of range.
RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT_CUSTOMERNUM_NOT_SET	Failed to activate lock! The lock customer number has not been set, or is out of range.
RC_ERR_FLM1_KEY_TYPE_REQUIRES_GEN2_ACTIVATED_LOCK	User FLM 1 key is a DS1963 model key. It can only be dispatched/reassigned to a Cencon Gen 2 lock activated in Gen 2 mode.
RC_ERR_FLM2_KEY_TYPE_REQUIRES_GEN2_ACTIVATED_LOCK	User FLM 2 key is a DS1963 model key. It can only be dispatched/reassigned to a Cencon Gen 2 lock activated in Gen 2 mode.
RC_ERR_FLMBOTH_KEY_TYPE_REQUIRES_GEN2_ACTIVATED_LOCK	Both User FLM 1 and FLM 2 keys are DS1963 model keys. They can only be dispatched/reassigned to a Cencon Gen 2 lock activated in Gen 2 mode.
RC_ERR_DELETE_LOCK_FAILED_DELETE_ROUTE_LOCK_ENTRIES	Failed to delete lock. A database error occurred while removing entries for the lock from the collection lock table.
RC_ERR_FAILED_UPDATE_USER	Failed to update user record in Cencon database. A database error occurred while updating the record.
RC_ERR_FAILED_UPDATE_MULTIPLE_USER_DESCRIPTORIAL_DATA	Failed to update descriptive data for multiple user records in Cencon database. A database error occurred while updating the multiple user records.
RC_ERR_FAILED_RENAME_CUSTOMER_ERROR_EXCEPTION	Failed to rename customer! An application exception occurred while updating the Cencon database.
RC_ERR_FAILED_RENAME_BANK_BRANCH_ERROR_EXCEPTION	Failed to rename bank branch! An application exception occurred while updating the Cencon database.
RC_ERR_FAILED_DETERMINE_DISPATCHER_REGION_AUTHORIZATION	Failed to determine dispatcher region authorization! The dispatcher region information was not found.
RC_ERR_NOT_AUTHORIZED_OPERATION_DUE_TO_REGION	The current dispatcher is not authorized to do the operation due to their region restriction. The operation affects data that is assigned to another region.
RC_ERR_FAILED_FIND_ROUTE	Failed to find route record entry in the Cencon database! The route may have been renamed or deleted.
RC_ERR_RESTORE_DELETED_LOCK_ALREADY_EXISTS_NAME_MODE	Failed to restore deleted lock! The lock name and mode already exist in the active lock table.
RC_ERR_RESTORE_DELETED_LOCK_ALREADY_EXISTS_SERIAL_NUMBER_MODE	Failed to restore deleted lock! The lock serial number and mode already exist in the active lock table.
RC_ERR_RESTORE_DELETED_LOCK_FAILED_INSERT_LOCK_TABLE	Failed to restore deleted lock! A database error occurred while inserting the deleted lock record back into the active lock table.
RC_ERR_RESTORE_DELETED_LOCK_FAILED_GET_BANK_MODE_USERS	Failed to restore deleted lock! Failed to get bank mode users for the restored lock from user lock history table. A database error occurred while querying the user lock history table.
RC_ERR_RESTORE_DELETED_LOCK_FAILED_RESTORE_ONE_OR_MORE_BANK_MODE_USERS	Failed to restore deleted lock! Failed to restore one or more bank mode users for the restored lock.
RC_ERR_RESTORE_DELETED_LOCK_BANK_MODE_BRANCH_NAME_DOESNT_EXIST	Failed to restore deleted lock! The bank mode branch name assigned to the lock does not exist.
RC_ERR_RESTORE_DELETED_LOCK_REGION_DOES_NOT_EXIST	Failed to restore deleted lock! The deleted lock's region does not exist, and region control is active.
RC_ERR_FORCE_DELETE_LOCK_FAILED_INSERT_BANK_USERS_INTO_HISTORY	Failed to force delete bank mode lock! A database error occurred while inserting the bank user records assigned to the lock into the user lock history table.

RC_ERR_FORCE_DELETE_LOCK_FAILED_GET_BANK_USERS	Failed to force delete bank mode lock! A database error occurred while querying the user lock table for the bank mode users assigned to the lock.
RC_ERR_REPLACE_LOCK_FAILED_INSERT_OLD_LOCK_INTO_LOCK_HISTORY_TABLE	Failed to replace lock! Failed to insert the old lock into the lock history table.
RC_ERR_REPLACE_LOCK_FAILED_OPEN_OLD_LOCK_USER_LOCK_TABLE_QUERY	Failed to replace lock! Failed to open query of the old lock's bank mode users from the user lock table.
RC_ERR_REPLACE_LOCK_FAILED_INSERT_OLD_LOCK_USER_LOCK_HISTORY_TABLE_ENTRIES	Failed to replace lock! Failed to insert the old lock's bank mode users into the user lock history table.
RC_ERR_REPLACE_LOCK_FAILED_DELETE_OLD_LOCK_USER_LOCK_TABLE_ENTRIES	Failed to replace lock! Failed to remove the old lock's bank mode users from the user lock table.
RC_ERR_REPLACE_LOCK_FAILED_DELETE_OLD_LOCK_FROM_LOCK_TABLE	Failed to replace lock! Failed to delete the old lock from the active lock table.
RC_ERR_UNDO_REPLACE_LOCK_FAILED_FIND_OLD_BANK_REPLACED_LOCK	Undo replace lock: Failed to find the record for the original Bank mode lock that had been replaced.
RC_ERR_UNDO_REPLACE_LOCK_BANK_LOCK_NOT_BEEN_REPLACED	Undo replace lock: Bank mode lock to undo replace is not a lock that has been replaced.
RC_ERR_UNDO_REPLACE_LOCK_FAILED_DELETE_REPLACEMENT_LOCK_USER_LOCK_TABLE_ENTRIES	Undo replace lock: Failed to delete the user lock table entries for the replacement lock.
RC_ERR_REPLACE_LOCK_FAILED_READ_DELETE_OLD_COLLECTION_RECORDS	Failed to replace lock! Failed to read and delete the references from the lock collections to the old lock.
RC_ERR_REPLACE_LOCK_FAILED_INSERT_UPDATED_COLLECTION_RECORDS	Failed to replace lock! Failed to insert updated references to the lock collections for the new lock.
RC_ERR_UNDO_REPLACE_LOCK_FAILED_READ_DELETE_COLLECTION_RECORDS	Undo replace lock: Failed to read and delete the references from the lock collections to the replacement lock.
RC_ERR_UNDO_REPLACE_LOCK_FAILED_INSERT_UPDATED_COLLECTION_RECORDS	Undo replace lock: Failed to insert updated references to the lock collections for the old lock.
RC_ERR_ACTIVATE_LOCK_REGION_NOT_SET_REGION_CONTROL_ACTIVE	Failed to activate lock! The lock being activated does not have a region set, and region control is active for using regions to restrict users to locks in the same region.
RC_ERR_SET_OPEN_DELAY_LOCK_OPEN_DELAY_WINDOW_OUT_OF_RANGE	Failed to set bank mode time delay and open window on lock! The values for the time delay and open window are out of range. They must both be within 1-99, or both be set to zero.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to initialize key to resynchronize lock dispatching! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_NOT_GEN2_LOCK	Failed to initialize key to resynchronize lock dispatching! The current lock is not a Cencon Gen 2 lock. The older Cencon Gen1 lock does not support this operation.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_INVALID_MODE	Failed to initialize key to resynchronize lock dispatching! The lock mode of the current lock is invalid. The lock must be either FLM or Route mode to resynchronize dispatching.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_NOT_FOUND	Failed to initialize key to resynchronize lock dispatching! The specified lock does not exist in the database.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_IS_DISPATCHED	Failed to initialize key to resynchronize lock dispatching! The specified lock is currently dispatched. You will need to close or use the Manager Force close the lock in the Cencon database.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_IS_NOT_ACTIVATED_AS_GEN2	Failed to initialize key to resynchronize lock dispatching! The specified lock is not activated as Gen 2. It is currently in compatibility mode with Cencon Gen1 for use with older software. You will need to update the activation of the lock as Gen 2.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_IS_NOT_ACTIVE_IN_DATABASE	Failed to initialize key to resynchronize lock dispatching! The specified lock is not active in the Cencon database. The lock must be active, it can not be shelved.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_INVALID_KEY_MODEL	Failed to initialize key to resynchronize lock dispatching! The model of key in the key reader is invalid. A DS1963 key model is required to set up a lock dispatch resynchronization key.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_IS_ASSIGNED_TO_USER	Failed to initialize key to resynchronize lock dispatching! The key in the key reader is currently assigned to an active user in the Cencon database. The key is already being used.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_IS_INSTALL_KEY	Failed to initialize key to resynchronize lock dispatching! The key in the key reader is an install key for the Cencon USB Key Box. It is not permitted for install keys to be overwritten.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to read key to resynchronize lock dispatching! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.

RC_ERR_RESYNC_DISPATCHING_READ_KEY_INVALID_KEY_MODEL	Failed to read key to resynchronize lock dispatching! The model of key in the key reader is invalid. A DS1963 key model is required for a lock dispatch resynchronization key.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_INCORRECT_KEY_MODE	Failed to read key to resynchronize lock dispatching! The lock mode specified by the key is invalid. The lock must be either FLM or Route mode to resynchronize dispatching.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_DATA_READ_ERROR	Failed to read key to resynchronize lock dispatching! An error occurred while reading the data from the key. The key data did not validate properly.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_RESYNC_KEY_NOT_USED	Failed to read key to resynchronize lock dispatching! The lock dispatch resynchronization key has not been used at the lock.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_LOCK_NOT_FOUND	Failed to read key to resynchronize lock dispatching! The lock specified by the lock dispatch resynchronization key could not be found in the Cencon database.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_NOT_GEN2_LOCK	Failed to read key to resynchronize lock dispatching! The lock specified by the lock dispatch resynchronization key is not a Cencon Gen 2 lock.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_UNABLE_TO_VERIFY_AS_VALID_KEY	Failed to read key to resynchronize lock dispatching! The lock dispatch resynchronization key data could not be validated against the lock security data.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_LOCK_NOT_IN_RESYNC_MODE	Failed to read key to resynchronize lock dispatching! The lock specified by the lock dispatch resynchronization key is not currently in the process of being resynchronized.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_FAILED_INSERT_INTO_HISTORY	Failed to read key to resynchronize lock dispatching! A database error occurred while inserting the original lock record into the Cencon database lock history table.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_FAILED_UPDATE_LOCK_RECORD	Failed to read key to resynchronize lock dispatching! A database error occurred while updating the lock record in the Cencon database lock table.
RC_ERR_RESYNC_DISPATCHING_READ_KEY_INCORRECT_KEY_TYPE	Failed to read key to resynchronize lock dispatching! The key being read is not a lock dispatch resynchronization key.
RC_ERR_FAILED_UPDATE_AUDIT_EVENT_NAMES	Failed to update audit event names for database table! A database error occurred while updating the table.
RC_ERR_FAILED_UPDATE_LOCK_DESCRIPTOR_DATA	Failed to update lock descriptive data! A database error occurred while updating the lock table.
RC_ERR_FAILED_UPDATE_LOG_DESCRIPTOR_DATA	Failed to update log descriptive data! A database error occurred while updating the log table.
RC_ERR_UPDATE_COMMON_FIELDS_FOR_TABLES_FIELD_COUNT_MISMATCH	Failed to update common fields in a database table! The primary and secondary table field counts did not match.
RC_ERR_FAILED_UPDATE_COMMON_FIELDS_FOR_TABLES	Failed to update common fields in a database table! A database error occurred while updating the table.
RC_ERR_DATABASE_CONNECTION_INVALID	Database operation failed! The database connection is invalid.
RC_ERR_DATABASE_OPERATION_RECORD_DATA_MISSING	Database operation failed! The record data is missing.
RC_ERR_DATABASE_OPERATION_RECORD_DATA_INVALID	Database operation failed! The record data is invalid.
RC_ERR_DATABASE_OPERATION_RECORD_NOT_FOUND_IN_DATABASE	Database operation failed! The record data was not found in the database.
RC_ERR_DATABASE_OPERATION_NO_PRIMARY_KEY_DEFINED_FOR_TABLE	Database operation failed! No primary key is defined for the affected table.
RC_ERR_DATABASE_OPERATION_NO_ROWS_AFFECTED	Database operation failed! No database table rows were affected by the operation.
RC_ERR_DATABASE_OPERATION_EXCEPTION_OCCURRED	Database operation failed! An internal application exception occurred while attempting the operation.
RC_ERR_DATABASE_OPERATION_FAILED_WITH_ERROR_FROM_DBMS	Database operation failed! An error was returned by the database management system for the attempted operation.
RC_ERR_FAILED_INSERT_AUDIT	Database operation failed! Failed to insert audit record into database table.
RC_ERR_FAILED_RENAME_USER_ERROR_CALL_STORED_PROCEDURE	Failed to rename user. A database error occurred during the call to the database stored procedure for changing the user ID.
RC_ERR_QUERY_USER_TABLE_NOT_AUTHORIZED_ON_SPECIFIED_ROLES	Logon User ID Authorization Role does not authorize performing a user table query on the specified roles.
RC_ERR_QUERY_USER_TABLE_HISTORY_NOT_AUTHORIZED_ON_SPECIFIED_ROLES	Logon User ID Authorization Role does not authorize performing a user history table query on the specified roles.
RC_ERR_QUERY_USER_TABLE_ARCHIVE_NOT_AUTHORIZED_ON_SPECIFIED_ROLES	Logon User ID Authorization Role does not authorize performing a user archive table query on the specified roles.
RC_ERR_FAILED_WRITE_OUTPUT_FILE	Failed to write the output file to disk! A disk operations error or conflict with another process occurred while writing the file.

RC_ERR_GET_STATUS_LOCK_SERIAL_PCIO_DEVICE_CANT_SUPPORT_GEN2	Failed to get lock status by serial connection! The current Cencon PCIO device does not support the Cencon Gen 2 Lock. You will need a Cencon USB Key Box to support the Cencon Gen 2 Lock.
RC_ERR_FAILED_OPEN_AUDIT_TABLE	Failed to open audit table! A database error occurred.
RC_ERR_AUDIT_NOT_FOUND	Failed to find audit primary key within audit table! The audit primary key value does not exist.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_BOLT_NOT_EXTENDED	Failed to close dispatched call to Cencon lock by serial connection. The lock bolt is not extended.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_BOLT_WORKS_NOT_EXTENDED	Failed to close dispatched call to Cencon lock by serial connection. The lock bolt works is not extended.
RC_ERR_CLOSE_LOCK_SERIAL_LOCK_ALTERNATE_CHANGE_KEY_INSERTED	Failed to close dispatched call to Cencon lock by serial connection. The lock alternate change key is inserted.
RC_ERR_RESYNC_DISPATCHING_LOCK_SERIAL_LOCK_MODE_NOT_ACTIVE	Failed to resynchronize dispatching of Cencon database lock entry by serial connection! The lock mode is not activated, but it is indicated as activated in the Cencon database. The lock mode has been shelved.
RC_ERR_FAILED_OPEN_DATABASE_CONNECTION	Failed to open the connection to the Cencon database! The database may be down or the database connection information may be invalid.
RC_ERR_FAILED_OPEN_AUTH_DEFINITION_TABLE	Failed to open the Cencon database authorization definition table! A database error occurred.
RC_ERR_NOT_AUTHORIZED_OPERATION_DUE_TO_MODE	The current dispatcher is not authorized to do the operation due to their lock mode restriction. The operation affects data that is assigned to a lock mode that the dispatcher is not authorized to access.
RC_ERR_INVALID_PWD_REC_KEY_TYPE_IS_ONLY_APPROPRIATE_FOR_CENCON_BANK	Invalid user record. The key type is only appropriate for Cencon lock Bank mode user keys.
RC_ERR_INVALID_PWD_REC_KEY_TYPE_IS_ONLY_APPROPRIATE_FOR_CENCON_FLM_ROUTE	Invalid user record. The key type is only appropriate for Cencon lock FLM and Route mode user keys.
RC_ERR_INVALID_PWD_REC_KEY_TYPE_IS_ONLY_APPROPRIATE_FOR_CENCON_LOGON	Invalid user record. The key type is only appropriate for Cencon software logon keys.
RC_ERR_FAILED_ADD_USER_KEY_UNKNOWN_OR_UNSUPPORTED_USER_ROLE	Failed to add user key. Unknown or unsupported user role.
RC_ERR_FAILED_ADD_USER_KEY_NOT_PERMITTED_OVERWRITE_INSTALL_KEY	Failed to add user key. It is not permitted to overwrite an install key with another key type.
RC_ERR_FAILED_ADD_USER_KEY_REGION_CONTROL_ACTIVE_BUT_REGION_NOT_SET	Failed to add user key. Region control is active, but the region for the new user key is not set.
RC_ERR_FAILED_ADD_USER_KEY_USER_ID_NOT_SET	Failed to add user key. User ID is not set.
RC_ERR_FAILED_ADD_USER_KEY_BANK_BRANCH_NAME_NOT_SET	Failed to add user key. Bank Branch Name is not set.
RC_ERR_FAILED_ADD_USER_KEY_BANK_USER_ID_NOT_SET	Failed to add user key. Bank User ID number is not set.
RC_ERR_INVALID_PWD_REC_NUMBER_TIME_WINDOWS_OUT_OF_RANGE	Invalid user record. The number of access time windows is out of range. This value can be 0 to 3 time windows.
RC_ERR_INVALID_PWD_REC_TIME_WINDOW_DURATION_NOT_SET	Invalid user record. An access time window duration is not set, where the number of time windows for the user has been set to one or more.
RC_ERR_FAILED_UPDATE_USER_KEY_UNKNOWN_OR_UNSUPPORTED_USER_ROLE	Failed to update user key. Unknown or unsupported user role.
RC_ERR_FAILED_READ_USER_KEY_UNKNOWN_OR_UNSUPPORTED_USER_ROLE	Failed to read user key. Unknown or unsupported user role.
RC_ERR_NOT_AUTHORIZED_TO_LOG_ON	The current dispatcher is not authorized to log onto Cencon or CenTran. Log On authorization is required to have access to Cencon operations or CenTran transactions.
RC_ERR_NOT_AUTHORIZED_USER_ACCESS_DISABLED	The current dispatcher is not authorized due to access being disabled. The user has been marked as having their access disabled and is restricted from Cencon operations or CenTran transactions.
RC_ERR_NOT_AUTHORIZED_BEFORE_ENABLED_START_DATE	The current dispatcher is not authorized due to the current time being before their enabled start date for access. User access can be restricted by start and end date.
RC_ERR_NOT_AUTHORIZED_AFTER_ENABLED_END_DATE	The current dispatcher is not authorized due to the current time being after their enabled end date for access. User access can be restricted by start and end date.
RC_ERR_SHELVE_LOCK_SERIAL_CHANGE_KEY_NOT_PRESENT	The lock mode could not be shelved across remote communications because a change key is not present in the lock and the Remote Shelve Change Key Control feature is enabled in the Cencon configuration settings.
RC_ERR_REGION_NOT_FOUND	Failed to find the region in the database region table. The region name is not in the database region table.

RC_ERR_BANK_BRANCH_NOT_FOUND	Failed to find the bank branch in the database bank branch table. The bank branch name is not in the database bank branch table.
RC_ERR_FAILED_DELETE_BANK_BRANCH_STILL_IN_USE	Failed to delete the bank branch from the database bank branch table. The bank branch is still in use by one or more locks or users.
RC_ERR_RENAME_FAILED_UPDATE_ROUTE_LOCK_FOR_RENAME	Failed to update the route lock entries when renaming lock.
RC_ERR_FAILED_OPEN_USER_LOCK_TABLE	Failed to open user lock table for reading bank mode user assignments to locks! A database error with the table query occurred.
RC_ERR_FAILED_QUERY_ROUTE_LOCK_ARCHIVE_TABLE_RESTORE_ROUTE	Failed to open route lock archive table for reading route locks to restore an archived route. A database error with the table query occurred.
RC_ERR_ADD_BANK_BRANCH_CUSTOMER_ID_NOT_FOUND	Failed to add bank branch! The specified associated customer ID doesn't exist.
RC_ERR_BANK_BRANCH_ID_FOR_NON1963_KEY_EXCEEDS_9999	ID of the bank branch assigned to a non DS1963 key exceeds 9999 which is not valid.
RC_ERR_BANK_BRANCH_ID_SEARCH_RANGE_EXCEEDS_MAX	Bank branch ID search failed. Specified range exceeded 2147483647.
RC_ERR_ADD_BANK_BRANCH_ZERO_BRANCH_ID	Bank branch ID of zero is not allowed.
RC_ERR_MODE_CANCEL_DISPATCH_ADVANCE_COMBO_INVALID_MODE	Failed to cancel dispatch and advance to next combination of Cencon lock by serial connection! The lock mode of the current lock is invalid. The lock mode must be either FLM or Route mode to cancel a dispatch at the lock and advance the lock mode to the next combination.
RC_ERR_FAILED_UPDATE_AUDIT	Database operation failed! Failed to update audit record in database table.
RC_ERR_CLOSE_LOCK_SERIAL_CORRUPT_LOCK_AUDIT_BAD_CRC	Failed to close dispatched call to Cencon lock by serial connection! One or more lock audits did not have a good CRC (Cyclic Redundancy Check).
RC_ERR_LOCK_SERIAL_CORRUPT_LOCK_AUDIT_BAD_CRC	Failed to read audits from lock by serial communications! One or more of the lock audits did not have a good CRC (Cyclic Redundancy Check).
RC_ERR_FAILED_DETERMINE_DATABASE_ODBC_DRIVER_VERSION	Failed to determine the database connection ODBC Driver Version!
RC_ERR_ODBC_DRIVER_VERSION_OUT_OF_DATE	The database connection configured Microsoft SQL ODBC Driver is out of date! Please install an updated Microsoft SQL ODBC Driver 2008 R2 or higher, and update your database connection with that ODBC driver.
RC_ERR_ADD_BANK_BRANCH_OUT_OF_RANGE_BRANCH_ID	Failed to add bank branch! Bank branch ID must be in the range of 1 to 2147483647.
RC_ERR_SET_TZDSTTABLE_LOCK_SERIAL_LOCK_MODE_NOT_ACTIVE	Failed to set time zone / daylight savings time transition table at lock by serial connection! The specified lock mode is not active.
RC_ERR_CHANGE_USER_COMBINATION_INVALID_VALUE	Failed to set the user bank mode combination. The new combination value is out of range. It must be in the range of 000000 to 999999, or set to -1 to indicate not set.
RC_ERR_CHANGE_USER_COMBINATION_FAILED_UPDATE_RECORD	Failed to set the user bank mode combination. A database error occurred while attempting to update the user record in the database.
RC_ERR_CHANGE_USER_COMBINATION_INVALID_USER_TYPE	Failed to set the user bank mode combination. The user type is not a bank mode lock user.
RC_ERR_FAILED_OPEN_CUSTOMER_TABLE	Failed to open customer table. The Cencon database connection may have been lost or the table may be missing.
RC_ERR_IMPORT_BANK_BRANCH_CONFLICTING_BRANCH_ID	Failed to create bank branch with information specified in import file. The bank branch already exists in the system with a different bank branch ID.
RC_ERR_IMPORT_LOCKS_FAILED_QUERY_BANK_BRANCH_TABLE	Failed to import lock. Unable to query the bank branch table.
RC_ERR_IMPORT_USER_CONFLICTING_BANK_MODE_INFORMATION	Failed to add user with information specified in import file. The key serial number already exists in the system with different bank mode information.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_DATA_CORRUPT	Failed to input combo to Cencon lock by serial connection and prompt IPI! Data given for lock is corrupt or invalid.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_NOT_GEN_2_LOCK	Failed to input combo to Cencon lock by serial connection and prompt IPI! The indicated lock serial number is not a Cencon Gen 2 lock.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_NOT_RESPONDING	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock is not responding across the serial connection.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_FAILED_TO_GET_SERIAL_NUMBER	Failed to input combo to Cencon lock by serial connection and prompt IPI! Failed to get the lock serial number from across the serial connection.

RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_FIRMWARE_OUT_OF_DATE	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock firmware version is out of date and does not support the operation to advance the combination for a mode. The lock firmware can be updated remotely from dormakaba across a network connection.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_CONNECTED_LOCK_SERIAL_NUM_DOESNT_MATCH	Failed to input combo to Cencon lock by serial connection and prompt IPI! The connected lock is not the one expected to advance a mode combination of. A different lock is connected than the serial number set up to advance a mode combination.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_IS_OPEN	Failed to input combo to Cencon lock by serial connection and prompt IPI! The connected lock is currently open.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_GEN_2_LOCK_IN_COMPATIBILITY_MODE	Failed to input combo to Cencon lock by serial connection and prompt IPI! The connected lock is operating in Cencon Gen 1 compatibility mode.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_MODE_NOT_ACTIVE	Failed to input combo to Cencon lock by serial connection and prompt IPI! The specified lock mode to advance the next combination of at the connected lock is not active.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_BOLT_RETRACTED	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock bolt is currently retracted.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_BOLT_NOT_EXTENDED	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock bolt is not extended.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_BOLT_WORKS_NOT_EXTENDED	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock bolt works is not extended.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_LOCK_IS_NOT_DISPATCHED	Failed to input combo to Cencon lock by serial connection and prompt IPI! The lock is not dispatched in the Cencon database.
RC_ERR_LOCK_SERIAL_INPUT_COMBO_IPI_INVALID_ROUTE_SEQUENCE	Failed to input combo to Cencon lock by serial connection and prompt IPI! The specified route sequence is not valid or is not dispatched.
RC_ERR_INIT_TIME_SET_KEY_INVALID_KEY_MODEL	Failed to initialize clock set key! The key is not a DS1922 clock set key.
RC_ERR_INIT_TIME_SET_KEY_FAILED_SET_KEY_PASSWORD	Failed to initialize clock set key! Failed to set the DS1922 key password.
RC_ERR_INIT_TIME_SET_KEY_FAILED_WRITE_CLOCK	Failed to initialize clock set key! Failed to write to the DS1922 key clock.
RC_ERR_INIT_TIME_SET_KEY_FAILED_WRITE_TIME_ZONE_ID	Failed to initialize clock set key! Failed to write the time zone ID to the DS1922 key memory.
RC_ERR_INIT_TIME_SET_KEY_FAILED_WRITE_DAYLIGHT_SAVINGS_TABLE	Failed to initialize clock set key! Failed to write the daylight savings time transition table to the DS1922 key memory.
RC_ERR_INIT_TIME_SET_KEY_FAILED_WRITE_VALIDATION_RECORD	Failed to initialize clock set key! Failed to write the validation record to the DS1922 key memory.
RC_ERR_INIT_TIME_SET_KEY_INVALID_TIME_ZONE_DATA	Failed to initialize clock set key! The specified time zone data is invalid.
RC_ERR_READ_TIME_SET_KEY_INVALID_KEY_MODEL	Failed to read clock set key! The key is not a DS1922 clock set key.
RC_ERR_READ_TIME_SET_KEY_FAILED_READ_CLOCK	Failed to read clock set key! Failed to read the DS1922 clock.
RC_ERR_READ_TIME_SET_KEY_FAILED_READ_TIME_ZONE_ID	Failed to read clock set key! Failed to read the time zone id.
RC_ERR_READ_TIME_SET_KEY_FAILED_READ_DST_TABLE_PAGE	Failed to read clock set key! Failed to read a page of the daylight savings time transition table from the DS1922 key memory.
RC_ERR_READ_TIME_SET_KEY_FAILED_READ_VALIDATION_RECORD	Failed to read clock set key! Failed to read the validation record from the DS1922 key memory.
RC_ERR_READ_TIME_SET_KEY_FAILED_READ_HEADER_RECORD	Failed to read clock set key! Failed to read the key header record.
RC_ERR_READ_TIME_SET_KEY_HEADER_RECORD_DATA_CORRUPT	Failed to read clock set key! The header record data is corrupt. The header record CRC is invalid.
RC_ERR_READ_TIME_SET_KEY_DATA_CORRUPT_SHA_HASH_INVALID	Failed to read clock set key! The clock set key data is corrupt. The SHA hash for the key data is invalid.
RC_ERR_READ_TIME_SET_KEY_DST_TABLE_PAGE_DATA_CORRUPT	Failed to read clock set key! A daylight savings table record data is corrupt. The daylight savings table record CRC is invalid.
RC_ERR_READ_RESYNC_KEY_INCORRECT_KEY_TYPE	Failed to read lock dispatch resynchronization key! The key is not initialized as a lock dispatch resynchronization key.
RC_ERR_READ_RESYNC_KEY_INVALID_LOCK_MODE	Failed to read lock dispatch resynchronization key! The lock mode indicated on the key is invalid.
RC_ERR_READ_RESYNC_KEY_FAILED_READ_LOCK_USER_DATA	Failed to read lock dispatch resynchronization key! Failed to read the lock dispatch resynchronization key user data.

RC_ERR_RESYNC_DISPATCHING_CANCEL_NOT_GEN2_LOCK	Failed to cancel resynchronize lock dispatching! The current lock is not a Cencon Gen 2 lock. The older Cencon Gen1 lock does not support this operation.
RC_ERR_RESYNC_DISPATCHING_CANCEL_INVALID_MODE	Failed to cancel resynchronize lock dispatching! The lock mode of the current lock is invalid. The lock must be either FLM or Route mode to resynchronize dispatching.
RC_ERR_RESYNC_DISPATCHING_CANCEL_LOCK_NOT_FOUND	Failed to cancel resynchronize lock dispatching! The specified lock does not exist in the database.
RC_ERR_RESYNC_DISPATCHING_CANCEL_LOCK_IS_NOT_ACTIVATED_AS_GEN2	Failed to cancel resynchronize lock dispatching! The specified lock is not activated as Gen 2. It is currently in compatibility mode with Cencon Gen1 for use with older software. You will need to update the activation of the lock as Gen 2.
RC_ERR_RESYNC_DISPATCHING_CANCEL_LOCK_IS_NOT_ACTIVE_IN_DATABASE	Failed to cancel resynchronize lock dispatching! The specified lock is not active in the Cencon database. The lock must be active, it can not be resynchronized dispatching.
RC_ERR_RESYNC_DISPATCHING_CANCEL_LOCK_IS_NOT_BEING_RESYNCD	Failed to cancel resynchronize lock dispatching! The specified lock is not being resynchronized dispatching.
RC_ERR_RESYNC_DISPATCHING_CANCEL_LOCK_IN_OTHER_DISPATCH_STATUS	Failed to cancel resynchronize lock dispatching! The specified lock has some other administrative dispatch status set.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_IS_ALREADY_BEING_RESYNCD	Failed to initialize key to resynchronize lock dispatching! The specified lock already has a resynchronization operation started, and a matching resynchronization key has already been initialized.
RC_ERR_RESYNC_DISPATCHING_INIT_KEY_LOCK_ALREADY_IN_OTHER_DISPATCH_STATUS	Failed to initialize key to resynchronize lock dispatching! The specified lock has some other administrative dispatch status set.
RC_ERR_FAILED_XML_IMPORT_FILE_NOT_FOUND	Failed to parse XML data from resource file for import. Resource file not found.
RC_ERR_ACTIVATE_G1_LOCK_BANK_1963_KEY_NOT_SUPPORTED	A bank mode user with a DS1963 key cannot be assigned to a Gen 1 lock.
RC_ERR_ACTIVATE_G1_LOCK_BANK_TOO_FEW_1427_KEYS	Gen 1 bank mode requires 2 or more users with DS1427 bank keys.
RC_ERR_NOT_AUTHORIZED_OPERATION_DUE_TO_RESTRICTED_REGION	The current dispatcher is not authorized to do the operation due to their region restriction.
RC_ERR_FAILED_UTC_DATE_TIME_RETRIEVAL	Failed to retrieve UTC date and time from database management system.

The following is a list of error codes (with description) that CenTran could return related to the Cencon PCIO PCI card when the incoming transaction file format is XML:

Message Name	Message Description
RC_ERR_PCIO_BAD_KEY_CRC	PCIO Data from key is corrupt
RC_ERR_PCIO_NAK	PCIO NAK returned
RC_ERR_PCIO_INVCMD	PCIO command was in error
RC_ERR_PCIO_PCIO_ID_BAD	PCIO invalid key for card
RC_ERR_PCIO_NOKEY	PCIO no key inserted
RC_ERR_PCIO_INVKEY	PCIO invalid key
RC_ERR_PCIO_TIMEOUT	PCIO timeout
RC_ERR_PCIO_KEYREADERR	PCIO key read error
RC_ERR_PCIO_UNKNOWN	PCIO unknown error
RC_ERR_PCIO_FAIL_OPEN_WINDRIVER_DEVICE	PCIO Driver Failed opening WinDriver device
RC_ERR_PCIO_INCORRECT_WINDRIVER_VERSION	PCIO Driver WinDriver is incorrect version
RC_ERR_PCIO_NO_DEVICES_FOUND	PCIO Driver Could not find PCIO Card
RC_ERR_PCIO_CARD_ID_OUT_OF_RANGE	PCIO Driver Card address not in range of valid addresses
RC_ERR_PCIO_FAILED_LOCKING_DEVICE	PCIO Driver Card failed to lock device
RC_ERR_PCIO_CARD_INCOMPLETE_FUNCTION	PCIO Driver Card does not have complete identification items
RC_ERR_PCIO_CARD_FUNCTION_UNRESPONSIVE	PCIO Driver Card does not respond
RC_ERR_PCIO_INVALID_VENDOR_ID	PCIO Driver Card Vendor I.D. is not correct
RC_ERR_PCIO_FAIL_OPEN_ALREADY_OPEN	PCIO Driver Card is already open
RC_ERR_PCIO_FAIL_SET_ADDRESS_ALREADY_OPEN	PCIO Driver Card with this address is already open
RC_ERR_PCIO_FAIL_OPEN_INVALID_ADDR	PCIO Driver Card has invalid address
RC_ERR_PCIO_FAIL_DATA_SEND_RECEIVE	PCIO Driver Card data transmission error
RC_ERR_PCIO_FAIL_DEVICE_NOT_OPEN	PCIO Driver Card is not open
RC_ERR_PCIO_FAIL_INVALID_DATA	PCIO Driver WinDriver function called incorrectly
RC_ERR_PCIO_MEMORY_ALLOCATION_ERROR	PCIO Driver WinDriver memory allocation error
RC_ERR_PCIO_EXCEPTION_OCCURRED	PCIO Driver Exception occurred during PCIO processing
RC_ERR_PCIO_UNKNOWN_DRIVER_ERROR	PCIO Driver Unknown Error code
RC_ERR_PCIO_FAILED_COUNT_PCI_CARDS	PCIO Driver Failed to get count of PCI cards in system
RC_ERR_PCIO_NO_PCIO_DEVICES_IN_SYSTEM	PCIO Driver No PCIO devices found in system
RC_ERR_PCIO_FAIL_REGISTER_WINDRIVER	PCIO Driver Failed to register with driver. Driver not installed or incompatible version.
RC_ERR_PCIO_FAIL_GET_PCIO_DEVICE_SERIAL_NUMBER	Failed to get Cencon PCIO Serial Number
RC_ERR_PCIO_FUNCTION_NOT_SUPPORTED_ON_PCIO_DEVICE_VERSION	The attempted operation is not supported on this version of Cencon PCIO device.

RC_ERR_PCIO_FAILED_RESCAN_SYSTEM_DEVICE_CHANGES	Configuration Manager Operation Error: Failed to rescan system configuration for device changes
RC_ERR_PCIO_FAILED_SET_WD_DRIVER_NAME	Failed to set WinDriver Driver name. A driver internal error occurred.
RC_ERR_PCIO_BAD_KEY_LOCK_RECORD_COUNT	Key lock record count does not match key header information.

The following is a list of error codes (with description) that CenTran could return related to the Cencon USB Key Box or the Cencon Gen 2 Lock serial communications when the incoming transaction file format is XML:

Message Name	Message Description
RC_ERR_PCIO_COMMS_FAILED_FIND_START_OF_FRAME	Communications Error - failed to find start of frame
RC_ERR_PCIO_COMMS_FAILED_FIND_END_OF_FRAME	Communications Error - failed to find end of frame
RC_ERR_PCIO_COMMS_FAILED_TO_SEND	Communications Error - failure sending data
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_NOT_OPEN	Communications Error - failure sending data - connection is not open
RC_ERR_PCIO_COMMS_FAILED_TO_SETUP_FOR_RECEIVE	Communications Error - failure setting up to read data
RC_ERR_PCIO_COMMS_FAILED_TO_READ_RECEIVED_DATA	Communications Error - failure reading data
RC_ERR_PCIO_COMMS_FAILED_TO_READ_TIMEOUT	Communications Error - failure reading data timed out waiting
RC_ERR_PCIO_COMMS_FAILED_TO_READ_BAD_CRC	Communications Error - failure reading crc was incorrect
RC_ERR_PCIO_COMMS_FAILED_TO_READ_NOT_OPEN	Communications Error - failure reading data - connection is not open
RC_ERR_PCIO_COMMS_RECEIVED_SOURCE_END_POINT_MISMATCHED	Communications Error - indicated source end point in response does not match what was sent
RC_ERR_PCIO_COMMS_RECEIVED_DESTINATION_END_POINT_MISMATCHED	Communications Error - indicated destination end point in response does not match what was sent
RC_ERR_PCIO_COMMS_RECEIVED_FRAME_ID_MISMATCHED	Communications Error - indicated frame id in response does not match what was sent
RC_ERR_PCIO_COMMS_RECEIVED_DATA_EMPTY	Communications Error - data received in response is empty
RC_ERR_PCIO_COMMS_RECEIVED_DATA_UNEXPECTED_SIZE	Communications Error - data received in response is not size as expected
RC_ERR_PCIO_COMMS_RECEIVED_COMMAND_RESPONSE_MISMATCHED	Communications Error - command in response does not match what was sent
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_CONNECTION	Communications Error - failed to open connection
RC_ERR_PCIO_COMMS_FAILED_TO_GET_COMM_STATE	Communications Error - failed to get communications state
RC_ERR_PCIO_COMMS_FAILED_TO_SET_COMM_STATE	Communications Error - failed to set communications state
RC_ERR_PCIO_COMMS_FAILED_TO_GET_COMM_TIMEOUTS	Communications Error - failed to get communications timeouts
RC_ERR_PCIO_COMMS_FAILED_TO_SET_COMM_TIMEOUTS	Communications Error - failed to set communications timeouts
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_ARG_NULL	Communications Error - failed to send - argument is null
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_ARG_OUT_OF_RANGE	Communications Error - failed to send - argument is out of range
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_ARG_EXCEPTION	Communications Error - failed to send - argument exception occurred
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_TIMEOUT	Communications Error - failed to send due to time out
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_ACCESS_DENIED	Communications Error - failed to open connection, access denied to port
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_INVALID_STATE	Communications Error - failed to open connection, port is in invalid state
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_INVALID_SETTINGS	Communications Error - failed to open connection, port settings are invalid
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_ALREADY_OPEN	Communications Error - failed to open connection, port is already open
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_ARG_EXCEPTION	Communications Error - failed to open connection, argument exception occurred
RC_ERR_PCIO_COMMS_INVALID_COMMAND	Received invalid command. The command received is unknown.
RC_ERR_PCIO_COMMS_INVALID_PARAMETER	Received invalid parameter. One or more parameters received is out of range or invalid.
RC_ERR_PCIO_COMMS_LOCKED	Received command not processed. Communications are locked, and must be unlocked before any commands will be accepted.
RC_ERR_PCIO_COMMS_COMMAND_NOT_IMPLEMENTED	Command not implemented. The command refers to an operation that this model of device does not support.
RC_ERR_PCIO_COMMS_TM_KEY_NOT_PRESENT	TM Key not present. The key operation can not be completed because there is no key in the indicated key reader slot.
RC_ERR_PCIO_COMMS_TM_KEY_INVALID_TYPE	TM Key is an invalid type. The key operation can not be completed because the key in the reader is the wrong type of key.
RC_ERR_PCIO_COMMS_TM_KEY_OPERATION_ERROR	TM Key operation error. The key operation failed at the key. Either communications failed with the key or there was a problem with the operation.
RC_ERR_PCIO_COMMS_INTERNAL_ERROR	Internal Error. An internal error with the operation of the USB Key Box occurred. Data stored by the USB Key Box may have been corrupted.
RC_ERR_PCIO_COMMS_UNKNOWN_STATUS_ERROR_CODE	The key box returned an unexpected unknown error code. An unknown type of error has occurred with the USB Key Box.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_NO_ERROR	Communications layer error response received - No error indicated.

RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_INVALID_ENDPOINT	Communications layer error response received - Command was sent to invalid device functionality endpoint.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_INVALID_CRC	Communications layer error response received - Command sent had invalid CRC. Data was corrupt.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_TIMEOUT	Communications layer error response received - Timed out waiting on remainder of command. Data was lost or interrupted.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_BUFFER_OVERFLOW	Communications layer error response received - Buffer overflow. The command sent was too large for the device.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_UNKNOWN_ERR_CODE	Communications layer error response received - The key box returned an unexpected error code for communications. An unknown type of error has occurred with the USB Key Box communications.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_INVALID_COMMAND	Communications layer error response received - Received invalid command. The command sent to the communication layer is not supported at the communications layer.
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_OBJ_DISPOSED_EXCEPTION	Communications Error - failed to send - connection has closed.
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_IO_EXCEPTION	Communications Error - failed to send - a driver IO exception occurred.
RC_ERR_PCIO_COMMS_FAILED_TO_READ_OBJ_DISPOSED_EXCEPTION	Communications Error - failed to read - connection has closed.
RC_ERR_PCIO_COMMS_FAILED_TO_READ_IO_EXCEPTION	Communications Error - failed to read - a driver IO exception occurred.
RC_ERR_PCIO_COMMS_FAILED_TO_RECONNECT	Failed to reconnect to Cencon Key Box. A error occurred while trying to reopen the device.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ERR_INVALID_END_OF_FRAME	Communications layer error response received - Received invalid end of frame. An end of frame communications marker was not received when one was expected to end a frame of data. Data was lost or corrupted.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ENCRYPT_LAYER_INVALID_COMMAND	Communications layer error response received - Encryption layer invalid command received.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ENCRYPT_LAYER_INVALID_PARAMETER	Communications layer error response received - Encryption layer invalid parameter received.
RC_ERR_PCIO_COMMS_COMMS_RESPONSE_ENCRYPT_LAYER_INTERNAL_ERROR	Communications layer error response received - Encryption layer internal error occurred. An internal error with the operation of the USB Key Box occurred. Data stored by the USB Key Box may have been corrupted.
RC_ERR_PCIO_COMMS_READ_TM_TIME_KEY_INVALID_CLOCK_VALUE	An invalid or corrupt clock time value was read from the TM Key.
RC_ERR_PCIO_COMMS_FAILED_DATA_SENT_IN_COMMAND_MISMATCHED_WITH_REPLY	Communications Error - The data received back in reply to a command did not match what was sent.
RC_ERR_PCIO_COMMS_FAILED_DETERMINE_SYSTEM_COMM_PORTS	Failed to determine the system USB serial comm ports.
RC_ERR_PCIO_COMMS_FAILED_FIND_CENCON_KEYBOX_CONNECTED_TO_SYSTEM	Failed to find the Cencon USB Key Box as being connected to the system.
RC_ERR_PCIO_COMMS_DEVICE_UNRESPONSIVE_ON_CONNECT	Device is not responsive after opening a connection to it.
RC_ERR_PCIO_COMMS_RECEIVED_DATA_INCOMPLETE	Communications Error - data received in response is incomplete.
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_SOCKET_EXCEPTION	Communications Error - A TCP communications exception occurred while trying to open the TCP connection.
RC_ERR_PCIO_COMMS_FAILED_TO_SEND_CONNECTION_NOT_CONFIGURED	Communications Error - Failed to send data. Communications connection has not been configured or opened.
RC_ERR_PCIO_COMMS_FAILED_TO_READ_CONNECTION_NOT_CONFIGURED	Communications Error - Failed to read data. Communications connection has not been configured or opened.
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_AUTHENTICATION_EXCEPTION	Communications Error - An authentication exception occurred while trying to open the TCP secure socket layer connection.
RC_ERR_PCIO_COMMS_FAILED_TO_OPEN_CONNECTION_NOT_CONFIGURED	Communications Error - Failed to open connection. Communications settings have not been configured for connection.
RC_ERR_PCIO_COMMS_ENCRYPTION_REQUIRED	Communications Error - The operation at the device requires the matching encryption to be used to authenticate the operation.
RC_ERR_PCIO_COMMS_DECRYPTION_FAILED	Communications Error - The command sent did not decrypt properly. The wrong encryption is being used for the device operation.
RC_ERR_PCIO_COMMS_UNSUPPORTED_ENCRYPTION_MODE	Communications Error - An unsupported form of encryption was specified with the command. The device does not support the encryption used.
RC_ERR_PCIO_COMMS_ERR_CHANGE_KEY_REQUIRED	The serial communications command received by the lock requires that a change key be inserted into the lock for the command to be executed, to verify access to the container.
RC_ERR_PCIO_COMMS_ERR_DOOR_CLOSED	The serial communications command received by the lock requires that the container door be open for the command to be executed, to verify access to the container.
RC_ERR_PCIO_DRIVER_IS_NOT_OPEN	The WinDriver connection for the Cencon USB Key Box is not open.
RC_ERR_PCIO_NO_ACTIVE_DEVICE_CONNECTED	There is no active device for the Cencon USB Key Box connected to the system.
RC_ERR_PCIO_COMMS_INVALID_NETWORK_ADDRESS	Communications Error - Invalid Network Address. Failed to set up IP address.
RC_ERR_PCIO_COMMS_FAILED_GET_COMMS_STATUS	Communications Error - Failed to query communications status.

RC_ERR_PCIO_COMMS_FAILED_GET_OPERATIONS_STATUS	Communications Error - Failed to query operations status.
RC_ERR_PCIO_COMMS_DEVICE_FIRMWARE_OUT_OF_DATE	Device firmware level is out of date to support current level of remote communications.
RC_ERR_PCIO_COMMS_FAILED_GET_PRODUCT_VERSION_INFO	Communications Error - Failed to query product version information.
RC_ERR_PCIO_COMMS_FAILED_GET_PRODUCT_SERIAL_NUMBER	Communications Error - Failed to query product serial number.
RC_ERR_PCIO_COMMS_FAILED_GET_PRODUCT_STATUS_INFO	Communications Error - Failed to query product status information.
RC_ERR_PCIO_COMMS_FAILED_GET_PRODUCT_HARDWARE_DIAG_INFO	Communications Error - Failed to query product hardware diagnostic information.
RC_ERR_PCIO_COMMS_FAILED_GET_PRODUCT_CLOCK_TIME	Communications Error - Failed to query product onboard clock time.
RC_ERR_PCIO_COMMS_FAILED_GET_LOCK_FLM_MODE_STATUS	Communications Error - Failed to query lock FLM mode status.
RC_ERR_PCIO_COMMS_FAILED_GET_LOCK_ROUTE_MODE_STATUS	Communications Error - Failed to query lock route mode status.
RC_ERR_PCIO_COMMS_FAILED_GET_LOCK_BANK_MODE_STATUS	Communications Error - Failed to query lock bank mode status.
RC_ERR_PCIO_COMMS_FAILED_SETUP_GET_LOCK_AUDIT_TRAIL	Communications Error - Failed to query lock for buffer information to setup for getting lock audit trail.
RC_ERR_PCIO_COMMS_FAILED_GET_LOCK_AUDIT_TRAIL	Communications Error - Failed to query lock for lock audit trail.
RC_ERR_PCIO_COMMS_APP_INTERNAL_EXCEPTION	Internal Application Exception - An internal application exception has occurred. Please contact dormakaba with the details of the unhandled application exception.
RC_ERR_PCIO_COMMS_FAILED_WRITE_LED_INDICATOR_LIGHTS	Communications Error - Failed to write LED indicator light status.
RC_ERR_PCIO_COMMS_FAILED_CONFIGURE_DEFAULT_COMMUNICATIONS_SECURITY	Communications Error - Failed to configure product default communications security.
RC_ERR_PCIO_COMMS_FAILED_CONFIGURE_ACTIVATED_COMMUNICATIONS_SECURITY	Communications Error - Failed to configure product activated communications security.
RC_ERR_PCIO_COMMS_FAILED_READ_LAST_INSTALL_INFO	Communications Error - Failed to read product last install information.
RC_ERR_PCIO_COMMS_KEY_BOX_NUM_INSTALLS_EXCEEDS_INSTALL_RESTRICTION_ON_KEY	The number of times this Cencon USB Key Box has been installed exceeds the install limit restriction on the install key. You will need to contact dormakaba concerning the options chosen when purchasing the Cencon installation.
RC_ERR_PCIO_COMMS_KEY_BOX_FAILED_WRITE_UPDATED_RESTRICTIONS	An error occurred while writing updated restrictions information to the Cencon USB Key Box.
RC_ERR_PCIO_COMMS_KEY_BOX_FAILED_READ_AUDIT_COUNT	An error occurred while reading the audit count from the Cencon USB Key Box.
RC_ERR_PCIO_COMMS_KEY_BOX_FAILED_WRITE_AUDIT_TO_KEY_BOX	An error occurred while writing an audit to the Cencon USB Key Box.
RC_ERR_PCIO_COMMS_KEY_BOX_FAILED_WRITE_LAST_INSTALL	An error occurred while updating the previous install information to the Cencon USB Key Box.
RC_ERR_PCIO_COMMS_INVALID_COMMUNICATIONS_ID	Communications Error - Invalid Communications ID. Failed to find specified TCP/IP connection.
RC_ERR_PCIO_COMMS_UNAVAILABLE_COMMUNICATIONS_ID	Communications Error - Unavailable Communications ID. The specified TCP/IP connection is already in use.
RC_ERR_PCIO_COMMS_OPEN_LOCK_CONNECTION_COMMS_NOT_OPEN	Communications Setup Error - Communications connection for lock is not open.
RC_ERR_PCIO_COMMS_ERR_MODE_CURRENTLY_OPEN_TO_ADVANCE_COMBO_STATE	The serial communications command received by the lock requires that the specified lock mode be closed for the command to be executed, to allow the lock mode combination state to be advanced forward.

The following is a list of error codes (with description) that CenTran could return related to the CenTran internal setup or operations.

Message Name	Message Description
RC_ERR_CENTRAN_FAILED_TO_INIT_KEYBOX_COMMS	CenTran Error - Failed to initialize USB KeyBox secure communications. The USB KeyBox install key may not have been used or did not match the device.
RC_ERR_CENTRAN_FAILED_DATABASE_CHECK_VALID	CenTran Error - The Cencon database validity check failed! The database is either missing data or tables or the database version is incompatible with this version of CenTran.
RC_ERR_CENTRAN_FAILED_DATABASE_CHECK_VERSION_NEWER_THAN_CENTRAN	CenTran Error - The Cencon database version check failed! The database version is newer than this version of CenTran.
RC_ERR_CENTRAN_FAILED_DATABASE_CHECK_VERSION_OLDER_THAN_CENTRAN	CenTran Error - The Cencon database version check failed! The database version is older than this version of CenTran.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_KEYBOX_NOT_PRESENT	CenTran Error - Failed security information check! The USB KeyBox is not present.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_KEYBOX_FIRMWARE_OUT_OF_DATE	CenTran Error - Failed security information check! The USB KeyBox firmware level is out of date.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_KEYBOX_NOT_INSTALLED	CenTran Error - Failed security information check! The USB KeyBox is not set up. The USB KeyBox install key may not have been used or did not match the device.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_DATABASE_CONNECTION_NOT_SET	CenTran Error - Failed security information check! The Cencon database connection is not set.

RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_COMPANY_NUMBER_NOT_SET	CenTran Error - Failed security information check! The company number is not set.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_DATABASE_CONFIG_NOT_PRESENT	CenTran Error - Failed security information check! The Cencon database configuration information is missing.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_KEYBOX_NOT_MATCH_DATABASE	CenTran Error - Failed security information check! The USB KeyBox security information does not match the Cencon database.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK_COMPANY_NUMBER_NOT_MATCH_DATABASE	CenTran Error - Failed security information check! The company number does not match the Cencon database.
RC_ERR_CENTRAN_FAILED_SECURITY_INFO_CHECK	CenTran Error - Failed security information check!
RC_ERR_CENTRAN_FAILED_READ_CENCON_DATABASE_CONFIG	CenTran Error - Failed to read the Cencon database configuration settings!
RC_ERR_CENTRAN_INPUT_FILE_LOCATION_NOT_SET	CenTran Error - Transaction Input file location not set!
RC_ERR_CENTRAN_OUTPUT_FILE_LOCATION_NOT_SET	CenTran Error - Transaction Output file location not set!
RC_ERR_CENTRAN_INPUT_OUTPUT_FILE_SETTINGS_ARE_THE_SAME	CenTran Error - Transaction Input and Output file settings are the same!
RC_ERR_CENTRAN_DEFAULT_DISPATCHER_IS_NOT_SET	CenTran Error - Default dispatcher ID is not set!
RC_ERR_CENTRAN_DEFAULT_DISPATCHER_NOT_FOUND_IN_CENCON_DATABASE	CenTran Error - Default dispatcher ID is not found in the Cencon database! You need to add the ID for the default dispatcher to be used by CenTran.
RC_ERR_CENTRAN_DEFAULT_DISPATCHER_NOT_AUTHORIZED	CenTran Error - Default dispatcher ID is not authorized! The default dispatcher ID is not a logon type user and is not authorized for any transactions.
RC_ERR_CENTRAN_SCHEMA_FILE_NOT_FOUND	CenTran Error - The CenTran XML Schema file is not found! The CenTran XML schema file is missing from the CenTran application directory.
RC_ERR_CENTRAN_FAILED_TO_PARSE_SCHEMA_FILE	CenTran Error - Failed to parse the CenTran XML Schema file! The schema file format could not be read.
RC_ERR_CENTRAN_FAILED_TO_PARSE_SCHEMA_FILE_NET	CenTran Error - Failed to parse the CenTran XML Schema file for .Net! The schema file format could not be read.
RC_ERR_CENTRAN_UNABLE_CHANGE_SETTINGS_CURRENTLY_PROCESSING_TRANSACTIONS	CenTran Error - Unable to change CenTran settings. CenTran is currently processing transactions. To change CenTran settings, you must stop processing transactions and restart processing when the settings changes are complete.
RC_ERR_CENTRAN_UNABLE_CHANGE_SETTINGS_KEYBOX_NOT_SETUP	CenTran Error - Unable to change CenTran settings. The USB KeyBox is not set up. The USB KeyBox install key may not have been used or did not match the device.
RC_ERR_CENTRAN_INVALID_ODBC_DATA_SOURCE_NAME	CenTran Error - Invalid ODBC data source name. The ODBC data source name given does not exist or is invalid.
RC_ERR_CENTRAN_FAILED_DETERMINE_DATABASE_SCHEMA	CenTran Error - Failed to determine Cencon database schema from database connection. A database error occurred.
RC_ERR_CENTRAN_FAILED_DETERMINE_DATABASE_SCHEMA_NONE_FOUND	CenTran Error - Failed to determine Cencon database schema from database connection. No Cencon database was found under any schema.
RC_ERR_CENTRAN_FAILED_DETERMINE_DATABASE_SCHEMA_TOO_MANY_FOUND	CenTran Error - Failed to determine Cencon database schema from database connection. Multiple Cencon databases were found under different schema.
RC_ERR_CENTRAN_INVALID_INPUT_FILE_DIRECTORY	CenTran Error - Failed to set file settings! The specified input file directory is invalid.
RC_ERR_CENTRAN_INVALID_OUTPUT_FILE_DIRECTORY	CenTran Error - Failed to set file settings! The specified output file directory is invalid.
RC_ERR_CENTRAN_INPUT_FILE_DIRECTORY_DOES_NOT_EXIST	CenTran Error - Failed to set file settings! The specified input file directory does not exist.
RC_ERR_CENTRAN_OUTPUT_FILE_DIRECTORY_DOES_NOT_EXIST	CenTran Error - Failed to set file settings! The specified output file directory does not exist.
RC_ERR_CENTRAN_INPUT_OUTPUT_FILE_SETTINGS_THE_SAME	CenTran Error - Failed to set file settings! The specified input and output file settings match. There is no way to identify input files from output files.
RC_ERR_CENTRAN_EMPTY_COMPANY_NUMBER	CenTran Error - Failed to set company number! The specified company number is empty.
RC_ERR_CENTRAN_INVALID_COMPANY_NUMBER	CenTran Error - Failed to set company number! The specified company number is invalid.
RC_ERR_CENTRAN_FAILED_READ_COMPANY_NUMBER_INFO_FROM_DATABASE	CenTran Error - Failed to read company number information from the Cencon database! The Cencon database may not have been completely set up from a Cencon installation.
RC_ERR_CENTRAN_FAILED_COMPANY_NUMBER_INFO_FROM_DATABASE_INVALID	CenTran Error - The company number information from the Cencon database is invalid! The Cencon database may not have been set up from a Cencon installation, or your security device does not match the Cencon database installation.
RC_ERR_CENTRAN_FAILED_READ_SECURITY_DEVICE_INFO_FROM_DATABASE	CenTran Error - Failed to read the security device information from the Cencon database! The Cencon database may not have been completely set up from a Cencon installation.
RC_ERR_CENTRAN_FAILED_SECURITY_DEVICE_INFO_FROM_DATABASE_INVALID	CenTran Error - The security device information from the Cencon database is invalid! The Cencon database may not have been set up from a Cencon installation, or your security device does not match the Cencon database installation.

RC_ERR_CENTRAN_FAILED_COMPANY_NUMBER_INFO_FROM_DATABASE_DOESNT_MATCH	CenTran Error - The specified company number does not match the Cencon database! You have either entered the company number incorrectly for your Cencon database or are incorrectly accessing another customer Cencon database installation.
RC_ERR_CENTRAN_FAILED_SECURITY_DEVICE_INFO_FROM_DATABASE_DOESNT_MATCH	CenTran Error - The security device information does not match the Cencon database! Your security device does not match the security set up for the connected Cencon database. You may be incorrectly accessing another customer Cencon database installation, or have an incorrectly set up security device.
RC_ERR_CENTRAN_INVALID_DEFAULT_DISPATCHER_ID	CenTran Error - Failed to set default dispatcher ID settings! The specified default dispatcher ID is invalid.
RC_ERR_CENTRAN_DATABASE_CONNECTION_USER_INVALID_NOT_MEMBER_CENCON_ROLE	CenTran Error - The database connection is invalid. The database user specified for the connection is not a member of the Cencon database role.
RC_ERR_CENTRAN_MISSING_INPUT_RECORD_FOR_TRANSACTION	CenTran Error - The expected input record for the transaction is invalid or missing. The call to CenTran was not provided the required data.
RC_ERR_CENTRAN_BETA_EXPIRED	CenTran Error - This CenTran Beta installation has expired. Transactions halted. Contact dormakaba Technical Support.
RC_ERR_CENTRAN_BETA_EXPIRE_WARNING	CenTran Error - This CenTran Beta installation will soon expire. Transactions will halt upon expiration.
RC_ERR_CENTRAN_RECEIVED_INVALID_XML_TRANSACTION	Centran Error - Received transaction with invalid XML formatting or data. Transaction can't be parsed into valid data to be processed.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_SERVICE_MODEL_CERTIFICATE_VALUE_BLANK	Centran Error - Failed to validate CenTran configuration file! One or more values to find the web service credentials certificate are blank in the CenTran configuration file (CenTran.exe.config). Use the CenTran Configuration Manager to set up the CenTran web service certificates.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_EXCEPTION	Centran Error - Failed to validate CenTran configuration file! An exception occurred while validating the CenTran configuration file settings.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_FAILED_OPEN	Centran Error - Failed to validate CenTran configuration file! Unable to open configuration file for validation.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_EXCEPTION_FAILED_OPEN	Centran Error - Failed to validate CenTran configuration file! Unable to open configuration file for validation. An exception occurred while attempting to load the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_SYSTEM_SERVICE_MODEL_SECTION_GROUP	Centran Error - Failed to validate CenTran configuration file! Failed to find the 'system.serviceModel' section group in the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_BEHAVIORS_SECTION	Centran Error - Failed to validate CenTran configuration file! Failed to find the 'behaviors' section in the 'system.serviceModel' section group in the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_NO_SERVICE_BEHAVIORS_DEFINED	Centran Error - Failed to validate CenTran configuration file! No service behaviors defined in the 'behaviors' section in the 'system.serviceModel' section group in the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_NO_SERVICE_BEHAVIOR_CERTIFICATE_DEFINED	Centran Error - Failed to validate CenTran configuration file! No certificate defined for service behavior in the 'behaviors' section in the 'system.serviceModel' section group in the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_CERTIFICATE_NOT_FOUND_IN_MACHINE_STORE	Centran Error - Failed to validate CenTran configuration file! Server local machine certificate store does not contain a certificate defined for service behavior in the 'behaviors' section in the 'system.serviceModel' section group in the configuration file.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_SECTION	Centran Error - Failed to validate CenTran configuration file! Failed to find the 'appSettings' section in the configuration file. The application settings configuration section is missing.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_NO_MANAGEMENT_CERTIFICATE	Centran Error - Failed to validate CenTran configuration file! Failed to find the 'HTTP_Management_Certificate_Thumbprint' entry in the configuration file application settings. The application settings configuration section entry for CenTran web based management security certificate is missing.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_MANAGEMENT_CERTIFICATE_BLANK	Centran Error - Failed to validate CenTran configuration file! Value for 'HTTP_Management_Certificate_Thumbprint' entry in the configuration file application settings is blank. The application settings configuration section entry for CenTran web based management security certificate has not been set.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_MANAGEMENT_CERTIFICATE_NOT_FOUND	Centran Error - Failed to validate CenTran configuration file! Server local machine certificate store does not contain the certificate defined for the CenTran web based management security certificate in the configuration file.

RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_NO_MANAGEMENT_URL	Centran Error - Failed to validate Centran configuration file! Failed to find the 'HTTP_Management_URL' entry in the configuration file application settings. The application settings configuration section entry for Centran web based management URL is missing.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_MANAGEMENT_URL_BLANK	Centran Error - Failed to validate Centran configuration file! Value for 'HTTP_Management_URL' entry in the configuration file application settings is blank. The application settings configuration section entry for Centran web based management URL has not been set.
RC_ERR_CENTRAN_VALIDATE_CONFIG_FILE_APP_SETTINGS_MANAGEMENT_CERTIFICATE_INVALID	Centran Error - Failed to validate Centran configuration file! Value for 'HTTP_Management_Certificate_Thumbprint' entry in the configuration file application settings is not a valid hexadecimal certificate thumb print value. The application settings configuration section entry for Centran web based management security certificate is corrupt.

The following is a list of error codes (with description) that could be returned by the Centran Agent usage of the Centran API. These error codes are mapped from the Centran API error codes.

Message Name	Message Description
RC_ERR_CENTRAN_API_unknown_CentranAPI_error_code	Centran API Error - The Centran API Error result is an unknown code or new code not supported by this software.
RC_ERR_CENTRAN_API_centran_returned_transaction_partially_successful	Centran API Error - The transaction was partially successful. Each of the affected items involved with the transaction will have an error code indicating success or failure.
RC_ERR_CENTRAN_API_centran_returned_transaction_failed	Centran API Error - The transaction failed.
RC_ERR_CENTRAN_API_centran_transaction_not_implemented	Centran API Error - The transaction is not yet implemented by Centran.
RC_ERR_CENTRAN_API_error_schema_file_not_found	Centran API Error - The schema file for Centran was not found.
RC_ERR_CENTRAN_API_error_input_transaction_file_name_invalid	Centran API Error - The transaction input file name for file based transactions is invalid.
RC_ERR_CENTRAN_API_error_input_transaction_uri_invalid	Centran API Error - The transaction input URI for web service based transactions is invalid.
RC_ERR_CENTRAN_API_error_input_directory_invalid	Centran API Error - The transaction input directory for file based transactions is invalid.
RC_ERR_CENTRAN_API_error_output_directory_invalid	Centran API Error - The transaction output directory for file based transactions is invalid.
RC_ERR_CENTRAN_API_error_schema_path_invalid	Centran API Error - The file path for the schema file is invalid.
RC_ERR_CENTRAN_API_error_timeout_value_invalid	Centran API Error - The timeout value for Centran file based transactions is an invalid value.
RC_ERR_CENTRAN_API_error_centran_input_output_file_extensions_and_directories_are_the_same	Centran API Error - The input and output file name extensions and file directories are the same for file based transactions.
RC_ERR_CENTRAN_API_error_centran_api_not_initialized_with_xml_schema	Centran API Error - The Centran API has not been initialized with a valid XML schema for Centran.
RC_ERR_CENTRAN_API_error_exception_during_centran_api_init	Centran API Error - An exception occurred during the Centran API initialization.
RC_ERR_CENTRAN_API_error_exception_during_centran_api_init_invalid_argument	Centran API Error - An exception occurred during the Centran API initialization. An invalid argument was encountered.
RC_ERR_CENTRAN_API_error_timed_out_waiting_for_centran_response	Centran API Error - Timed out waiting for a response from Centran during file based transactions.
RC_ERR_CENTRAN_API_error_failed_to_validate_centran_response_xml	Centran API Error - Failed to validate the Centran response XML data.
RC_ERR_CENTRAN_API_error_exception_while_validating_centran_response_xml	Centran API Error - An exception occurred while attempting to validate the Centran response XML data.
RC_ERR_CENTRAN_API_error_exception_during_communications	Centran API Error - An unknown exception occurred during API communications.
RC_ERR_CENTRAN_API_error_internal_error_centran_response_data_is_null	Centran API Error - The data returned from Centran is NULL. An internal error may have occurred with Centran.
RC_ERR_CENTRAN_API_error_internal_error_expected_centran_response_is_missing	Centran API Error - The expected Centran response is missing. An internal error may have occurred with Centran.
RC_ERR_CENTRAN_API_error_internal_error_centran_result_record_is_missing	Centran API Error - The expected Centran result record is missing from the response. An internal error may have occurred with Centran.
RC_ERR_CENTRAN_API_error_internal_error_failed_to_convert_centran_query_count_response	Centran API Error - Failed to convert the Centran query count response. An internal error may have occurred with Centran.
RC_ERR_CENTRAN_API_error_input_data_to_api_call_is_invalid	Centran API Error - The input data to an API call is invalid.
RC_ERR_CENTRAN_API_web_service_Continue	Centran API Error - HTTP status 100. Continue indicates that the client can continue with its request.
RC_ERR_CENTRAN_API_web_service_SwitchingProtocols	Centran API Error - HTTP status 101. SwitchingProtocols indicates that the protocol version or protocol is being changed.

RC_ERR_CENTRAN_API_web_service_Created	Centran API Error - HTTP status 201. Created indicates that the request resulted in a new resource created before the response was sent.
RC_ERR_CENTRAN_API_web_service_Accepted	Centran API Error - HTTP status 202. Accepted indicates that the request has been accepted for further processing.
RC_ERR_CENTRAN_API_web_service_NonAuthoritativeInformation	Centran API Error - HTTP status 203. NonAuthoritativeInformation indicates that the returned metainformation is from a cached copy instead of the origin server and therefore may be incorrect.
RC_ERR_CENTRAN_API_web_service_NoContent	Centran API Error - HTTP status 204. NoContent indicates that the request has been successfully processed and that the response is intentionally blank.
RC_ERR_CENTRAN_API_web_service_ResetContent	Centran API Error - HTTP status 205. ResetContent indicates that the client should reset (not reload) the current resource.
RC_ERR_CENTRAN_API_web_service_PartialContent	Centran API Error - HTTP status 206. PartialContent indicates that the response is a partial response as requested by a GET request that includes a byte range.
RC_ERR_CENTRAN_API_web_service_MultipleChoices	Centran API Error - HTTP status 300. MultipleChoices indicates that the requested information has multiple representations. The default action is to treat this status as a redirect and follow the contents of the Location header associated with this response. MultipleChoices is a synonym for Ambiguous.
RC_ERR_CENTRAN_API_web_service_Ambiguous	Centran API Error - HTTP status 300. Ambiguous indicates that the requested information has multiple representations. The default action is to treat this status as a redirect and follow the contents of the Location header associated with this response. Ambiguous is a synonym for MultipleChoices.
RC_ERR_CENTRAN_API_web_service_MovedPermanently	Centran API Error - HTTP status 301. MovedPermanently indicates that the requested information has been moved to the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. MovedPermanently is a synonym for Moved.
RC_ERR_CENTRAN_API_web_service_Moved	Centran API Error - HTTP status 301. Moved indicates that the requested information has been moved to the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. When the original request method was POST, the redirected request will use the GET method. Moved is a synonym for MovedPermanently.
RC_ERR_CENTRAN_API_web_service_Found	Centran API Error - HTTP status 302. Found indicates that the requested information is located at the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. When the original request method was POST, the redirected request will use the GET method. Found is a synonym for Redirect.
RC_ERR_CENTRAN_API_web_service_Redirect	Centran API Error - HTTP status 302. Redirect indicates that the requested information is located at the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. When the original request method was POST, the redirected request will use the GET method. Redirect is a synonym for Found.
RC_ERR_CENTRAN_API_web_service_SeeOther	Centran API Error - HTTP status 303. SeeOther automatically redirects the client to the URI specified in the Location header as the result of a POST. The request to the resource specified by the Location header will be made with a GET. SeeOther is a synonym for RedirectMethod.
RC_ERR_CENTRAN_API_web_service_RedirectMethod	Centran API Error - HTTP status 303. RedirectMethod automatically redirects the client to the URI specified in the Location header as the result of a POST. The request to the resource specified by the Location header will be made with a GET. RedirectMethod is a synonym for SeeOther.
RC_ERR_CENTRAN_API_web_service_NotModified	Centran API Error - HTTP status 304. NotModified indicates that the client's cached copy is up to date. The contents of the resource are not transferred.
RC_ERR_CENTRAN_API_web_service_UseProxy	Centran API Error - HTTP status 305. UseProxy indicates that the request should use the proxy server at the URI specified in the Location header.
RC_ERR_CENTRAN_API_web_service_Unused	Centran API Error - HTTP status 306. Unused is a proposed extension to the HTTP/1.1 specification that is not fully specified.
RC_ERR_CENTRAN_API_web_service_TemporaryRedirect	Centran API Error - HTTP status 307. TemporaryRedirect indicates that the request information is located at the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. When the original request method was POST, the redirected request will also use the POST method. TemporaryRedirect is a synonym for RedirectKeepVerb.

RC_ERR_CENTRAN_API_web_service_RedirectKeepVerb	Centran API Error - HTTP status 307. RedirectKeepVerb indicates that the request information is located at the URI specified in the Location header. The default action when this status is received is to follow the Location header associated with the response. When the original request method was POST, the redirected request will also use the POST method. RedirectKeepVerb is a synonym for TemporaryRedirect.
RC_ERR_CENTRAN_API_web_service_BadRequest	Centran API Error - HTTP status 400. BadRequest indicates that the request could not be understood by the server. BadRequest is sent when no other error is applicable, or if the exact error is unknown or does not have its own error code.
RC_ERR_CENTRAN_API_web_service_Unauthorized	Centran API Error - HTTP status 401. Unauthorized indicates that the requested resource requires authentication. The WWW-Authenticate header contains the details of how to perform the authentication.
RC_ERR_CENTRAN_API_web_service_PaymentRequired	Centran API Error - HTTP status 402. PaymentRequired is reserved for future use.
RC_ERR_CENTRAN_API_web_service_Forbidden	Centran API Error - HTTP status 403. Forbidden indicates that the server refuses to fulfill the request.
RC_ERR_CENTRAN_API_web_service_NotFound	Centran API Error - HTTP status 404. NotFound indicates that the requested resource does not exist on the server.
RC_ERR_CENTRAN_API_web_service_MethodNotAllowed	Centran API Error - HTTP status 405. MethodNotAllowed indicates that the request method (POST or GET) is not allowed on the requested resource.
RC_ERR_CENTRAN_API_web_service_NotAcceptable	Centran API Error - HTTP status 406. NotAcceptable indicates that the client has indicated with Accept headers that it will not accept any of the available representations of the resource.
RC_ERR_CENTRAN_API_web_service_ProxyAuthenticationRequired	Centran API Error - HTTP status 407. ProxyAuthenticationRequired indicates that the requested proxy requires authentication. The Proxy-authenticate header contains the details of how to perform the authentication.
RC_ERR_CENTRAN_API_web_service_RequestTimeout	Centran API Error - HTTP status 408. RequestTimeout indicates that the client did not send a request within the time the server was expecting the request.
RC_ERR_CENTRAN_API_web_service_Conflict	Centran API Error - HTTP status 409. Conflict indicates that the request could not be carried out because of a conflict on the server.
RC_ERR_CENTRAN_API_web_service_Gone	Centran API Error - HTTP status 410. Gone indicates that the requested resource is no longer available.
RC_ERR_CENTRAN_API_web_service_LengthRequired	Centran API Error - HTTP status 411. LengthRequired indicates that the required Content-length header is missing.
RC_ERR_CENTRAN_API_web_service_PreconditionFailed	Centran API Error - HTTP status 412. PreconditionFailed indicates that a condition set for this request failed, and the request cannot be carried out. Conditions are set with conditional request headers like If-Match, If-None-Match, or If-Unmodified-Since.
RC_ERR_CENTRAN_API_web_service_RequestEntityTooLarge	Centran API Error - HTTP status 413. RequestEntityTooLarge indicates that the request is too large for the server to process.
RC_ERR_CENTRAN_API_web_service_RequestUriTooLong	Centran API Error - HTTP status 414. RequestUriTooLong indicates that the URI is too long.
RC_ERR_CENTRAN_API_web_service_UnsupportedMediaType	Centran API Error - HTTP status 415. UnsupportedMediaType indicates that the request is an unsupported type.
RC_ERR_CENTRAN_API_web_service_RequestedRangeNotSatisfiable	Centran API Error - HTTP status 416. RequestedRangeNotSatisfiable indicates that the range of data requested from the resource cannot be returned, either because the beginning of the range is before the beginning of the resource, or the end of the range is after the end of the resource.
RC_ERR_CENTRAN_API_web_service_ExpectationFailed	Centran API Error - HTTP status 417. ExpectationFailed indicates that an expectation given in an Expect header could not be met by the server.
RC_ERR_CENTRAN_API_web_service_InternalServerError	Centran API Error - HTTP status 500. InternalServerError indicates that a generic error has occurred on the server.
RC_ERR_CENTRAN_API_web_service_NotImplemented	Centran API Error - HTTP status 501. NotImplemented indicates that the server does not support the requested function.
RC_ERR_CENTRAN_API_web_service_BadGateway	Centran API Error - HTTP status 502. BadGateway indicates that an intermediate proxy server received a bad response from another proxy or the origin server.
RC_ERR_CENTRAN_API_web_service_ServiceUnavailable	Centran API Error - HTTP status 503. ServiceUnavailable indicates that the server is temporarily unavailable, usually due to high load or maintenance.
RC_ERR_CENTRAN_API_web_service_GatewayTimeout	Centran API Error - HTTP status 504. GatewayTimeout indicates that an intermediate proxy server timed out while waiting for a response from another proxy or the origin server.

RC_ERR_CENTRAN_API_web_service_HttpVersionNotSupported	Centran API Error - HTTP status 505. HttpVersionNotSupported indicates that the requested HTTP version is not supported by the server.
RC_ERR_CENTRAN_API_web_service_UnknownErrorType	Centran API Error - An unknown type of HTTP error occurred with the response from the Centran web service.
RC_ERR_CENTRAN_API_soap_no_response	Centran API Error - A call to the SOAP web service did not respond.
RC_ERR_CENTRAN_API_soap_exception	Centran API Error - A call to the SOAP web service resulted in an exception.
RC_ERR_CENTRAN_API_web_exception_NameResolutionFailure	Centran API Error - The name resolver service could not resolve the host name.
RC_ERR_CENTRAN_API_web_exception_ConnectFailure	Centran API Error - The remote service point could not be contacted at the transport level.
RC_ERR_CENTRAN_API_web_exception_ReceiveFailure	Centran API Error - A complete response was not received from the remote server.
RC_ERR_CENTRAN_API_web_exception_SendFailure	Centran API Error - A complete request could not be sent to the remote server.
RC_ERR_CENTRAN_API_web_exception_PipelineFailure	Centran API Error - The request was a pipelined request and the connection was closed before the response was received.
RC_ERR_CENTRAN_API_web_exception_RequestCanceled	Centran API Error - The request was canceled, aborted, or an unclassifiable error occurred. This is the default value for Status.
RC_ERR_CENTRAN_API_web_exception_ProtocolError	Centran API Error - The response received from the server was complete but indicated a protocol-level error. For example, an HTTP protocol error such as 401 Access Denied would use this status.
RC_ERR_CENTRAN_API_web_exception_ConnectionClosed	Centran API Error - The connection was prematurely closed.
RC_ERR_CENTRAN_API_web_exception_TrustFailure	Centran API Error - A server certificate could not be validated.
RC_ERR_CENTRAN_API_web_exception_SecureChannelFailure	Centran API Error - An error occurred while establishing a connection using SSL.
RC_ERR_CENTRAN_API_web_exception_ServerProtocolViolation	Centran API Error - The server response was not a valid HTTP response.
RC_ERR_CENTRAN_API_web_exception_KeepAliveFailure	Centran API Error - The connection for a request that specifies the Keep-alive header was closed unexpectedly.
RC_ERR_CENTRAN_API_web_exception_Pending	Centran API Error - An internal asynchronous request is pending.
RC_ERR_CENTRAN_API_web_exception_Timeout	Centran API Error - No response was received during the time-out period for a request.
RC_ERR_CENTRAN_API_web_exception_ProxyNameResolutionFailure	Centran API Error - The name resolver service could not resolve the proxy host name.
RC_ERR_CENTRAN_API_web_exception_UnknownError	Centran API Error - An exception of unknown type has occurred.
RC_ERR_CENTRAN_API_web_exception_MessageLengthLimitExceeded	Centran API Error - A message was received that exceeded the specified limit when sending a request or receiving a response from the server.
RC_ERR_CENTRAN_API_web_exception_CacheEntryNotFound	Centran API Error - The specified cache entry was not found.
RC_ERR_CENTRAN_API_web_exception_RequestProhibitedByCachePolicy	Centran API Error - The request was not permitted by the cache policy. In general, this occurs when a request is not cacheable and the effective policy prohibits sending the request to the server. You might receive this status if a request method implies the presence of a request body, a request method requires direct interaction with the server, or a request contains a conditional header.
RC_ERR_CENTRAN_API_web_exception_RequestProhibitedByProxy	Centran API Error - This request was not permitted by the proxy.

The following is a list of error codes (with description) that could be returned by commands to the Centran Agent. The Centran Agent programming guide has details on the Centran Agent commands.

Message Name	Message Description
RC_ERR_CENTRAN_AGENT_SET_TCP_TIMEOUT_ERROR	Centran Agent Error - An exception occurred while trying to set a timeout limit on a network connection
RC_ERR_CENTRAN_AGENT_TCP_READ_EXCEPTION	Centran Agent Error - An exception occurred trying to read from a network connection
RC_ERR_CENTRAN_AGENT_TCP_WRITE_EXCEPTION	Centran Agent Error - An exception occurred trying to write to a network connection
RC_ERR_CENTRAN_AGENT_INCOMPLETE_TCP_FRAME	Centran Agent Error - An error occurred reading from a network connection
RC_ERR_CENTRAN_AGENT_INCOMPLETE_LOCK_FRAME	Centran Agent Error - An error occurred reading from the lock
RC_ERR_CENTRAN_AGENT_CONNECTION_TIMEOUT	Centran Agent Error - A network connection timed out
RC_ERR_CENTRAN_AGENT_HEARTBEAT_TIMEOUT	Centran Agent Error - A persistent connection timed out
RC_ERR_CENTRAN_AGENT_UNABLE_TO_OPEN_LOCK_CONNECTION	Centran Agent Error - Unable to open connection to the lock

The following is a list of error codes (with description) that could be returned by Centran related to Windows Sockets network communications.

Message Name	Message Description

RC_ERR_WSA_INVALID_HANDLE	Windows Socket Error - Specified event object handle is invalid. An application attempts to use an event object, but the specified handle is not valid. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSA_NOT_ENOUGH_MEMORY	Windows Socket Error - Insufficient memory available. An application used a Windows Sockets function that directly maps to a Windows function. The Windows function is indicating a lack of required memory resources. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSA_INVALID_PARAMETER	Windows Socket Error - One or more parameters are invalid. An application used a Windows Sockets function which directly maps to a Windows function. The Windows function is indicating a problem with one or more parameters. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSA_OPERATION_ABORTED	Windows Socket Error - Overlapped operation aborted. An overlapped operation was canceled due to the closure of the socket, or the execution of the SIO_FLUSH command in WSAIocctl. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSA_IO_INCOMPLETE	Windows Socket Error - Overlapped I/O event object not in signaled state. The application has tried to determine the status of an overlapped operation which is not yet completed. Applications that use WSAGetOverlappedResult (with the fWait flag set to FALSE) in a polling mode to determine when an overlapped operation has completed, get this error code until the operation is complete. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSA_IO_PENDING	Windows Socket Error - Overlapped operations will complete later. The application has initiated an overlapped operation that cannot be completed immediately. A completion indication will be given later when the operation has been completed. Note that this error is returned by the operating system, so the error number may change in future releases of Windows.
RC_ERR_WSAEINTR	Windows Socket Error - Interrupted function call. A blocking operation was interrupted by a call to WSACancelBlockingCall.
RC_ERR_WSAEBADF	Windows Socket Error - File handle is not valid. The file handle supplied is not valid.
RC_ERR_WSAEACCES	Windows Socket Error - Permission denied. An attempt was made to access a socket in a way forbidden by its access permissions. An example is using a broadcast address for sendto without broadcast permission being set using setsockopt(SO_BROADCAST). Another possible reason for the WSAEACCES error is that when the bind function is called (on Windows NT 4.0 with SP4 and later), another application, service, or kernel mode driver is bound to the same address with exclusive access.
RC_ERR_WSAEFAULT	Windows Socket Error - Bad address. The system detected an invalid pointer address in attempting to use a pointer argument of a call. This error occurs if an application passes an invalid pointer value, or if the length of the buffer is too small. For instance, if the length of an argument, which is a sockaddr structure, is smaller than the sizeof(sockaddr).
RC_ERR_WSAEINVAL	Windows Socket Error - Invalid argument. Some invalid argument was supplied (for example, specifying an invalid level to the setsockopt function). In some instances, it also refers to the current state of the socket? for instance, calling accept on a socket that is not listening.
RC_ERR_WSAEMFILE	Windows Socket Error - Too many open files. Too many open sockets. Each implementation may have a maximum number of socket handles available, either globally, per process, or per thread.
RC_ERR_WSAEWOULDBLOCK	Windows Socket Error - Resource temporarily unavailable. This error is returned from operations on nonblocking sockets that cannot be completed immediately, for example recv when no data is queued to be read from the socket. It is a nonfatal error, and the operation should be retried later. It is normal for WSAEWOULDBLOCK to be reported as the result from calling connect on a nonblocking SOCK_STREAM socket, since some time must elapse for the connection to be established.
RC_ERR_WSAEINPROGRESS	Windows Socket Error - Operation now in progress. A blocking operation is currently executing. Windows Sockets only allows a single blocking operation?per- task or thread?to be outstanding, and if any other function call is made (whether or not it references that or any other socket) the function fails with the WSAEINPROGRESS error.
RC_ERR_WSAEALREADY	Windows Socket Error - Operation already in progress. An operation was attempted on a nonblocking socket with an operation already in progress?that is, calling connect a second time on a nonblocking socket that is already connecting, or canceling an asynchronous request (WSAAsyncGetXbyY) that has already been canceled or completed.
RC_ERR_WSAENOTSOCK	Windows Socket Error - Socket operation on nonsocket. An operation was attempted on something that is not a socket. Either the socket handle parameter did not reference a valid socket, or for select, a member of an fd_set was not valid.
RC_ERR_WSAEDESTADDRREQ	Windows Socket Error - Destination address required. A required address was omitted from an operation on a socket. For example, this error is returned if sendto is called with the remote address of ADDR_ANY.
RC_ERR_WSAEMSGSIZE	Windows Socket Error - Message too long. A message sent on a datagram socket was larger than the internal message buffer or some other network limit, or the buffer used to receive a datagram was smaller than the datagram itself.
RC_ERR_WSAEPROTOTYPE	Windows Socket Error - Protocol wrong type for socket. A protocol was specified in the socket function call that does not support the semantics of the socket type requested. For example, the ARPA Internet UDP protocol cannot be specified with a socket type of SOCK_STREAM.
RC_ERR_WSAENOPROTOOPT	Windows Socket Error - Bad protocol option. An unknown, invalid or unsupported option or level was specified in a getsockopt or setsockopt call.
RC_ERR_WSAEPROTONOSUPPORT	Windows Socket Error - Protocol not supported. The requested protocol has not been configured into the system, or no implementation for it exists. For example, a socket call requests a SOCK_DGRAM socket, but specifies a stream protocol.
RC_ERR_WSAESOCKTNOSUPPORT	Windows Socket Error - Socket type not supported. The support for the specified socket type does not exist in this address family. For example, the optional type SOCK_RAW might be selected in a socket call, and the implementation does not support SOCK_RAW sockets at all.
RC_ERR_WSAEOPNOTSUPP	Windows Socket Error - Operation not supported. The attempted operation is not supported for the type of object referenced. Usually this occurs when a socket descriptor to a socket that cannot support this operation is trying to accept a connection on a datagram socket.
RC_ERR_WSAEPFNOSUPPORT	Windows Socket Error - Protocol family not supported. The protocol family has not been configured into the system or no implementation for it exists. This message has a slightly different meaning from WSAEAFNOSUPPORT. However, it is interchangeable in most cases, and all Windows Sockets functions that return one of these messages also specify WSAEAFNOSUPPORT.
RC_ERR_WSAEAFNOSUPPORT	Windows Socket Error - Address family not supported by protocol family. An address incompatible with the requested protocol was used. All sockets are created with an associated address family (that is, AF_INET for Internet Protocols) and a generic protocol type (that is, SOCK_STREAM). This error is returned if an incorrect protocol is explicitly requested in the socket call, or if an address of the wrong family is used for a socket, for example, in sendto.
RC_ERR_WSAEADDRINUSE	Windows Socket Error - Address already in use. Typically, only one usage of each socket address (protocol/IP address/port) is permitted. This error occurs if an application attempts to bind a socket to an IP address/port that has already been used for an existing socket, or a socket that was not closed properly, or one that is still in the process of closing. For server applications that need to bind multiple sockets to the same port number, consider using setsockopt(SO_REUSEADDR). Client applications usually need not call bind at all?connect chooses an unused port automatically. When bind is called with a wildcard address (involving ADDR_ANY), a WSAEADDRINUSE error could be delayed until the specific address is committed. This could happen with a call to another function later, including connect, listen, WSACconnect, or WSAJoinLeaf.

RC_ERR_WSAEADDRNOTAVAIL	Windows Socket Error - Cannot assign requested address. The requested address is not valid in its context. This normally results from an attempt to bind to an address that is not valid for the local computer. This can also result from connect, sendto, WSAConnect, WSAJoinLeaf, or WSAConnectTo when the remote address or port is not valid for a remote computer (for example, address or port 0).
RC_ERR_WSAENETDOWN	Windows Socket Error - Network is down. A socket operation encountered a dead network. This could indicate a serious failure of the network system (that is, the protocol stack that the Windows Sockets DLL runs over), the network interface, or the local network itself.
RC_ERR_WSAENETUNREACH	Windows Socket Error - Network is unreachable. A socket operation was attempted to an unreachable network. This usually means the local software knows no route to reach the remote host.
RC_ERR_WSAENETRESET	Windows Socket Error - Network dropped connection on reset. The connection has been broken due to keep-alive activity detecting a failure while the operation was in progress. It can also be returned by setsockopt if an attempt is made to set SO_KEEPALIVE on a connection that has already failed.
RC_ERR_WSAECONNABORTED	Windows Socket Error - Software caused connection abort. An established connection was aborted by the software in your host computer, possibly due to a data transmission time-out or protocol error.
RC_ERR_WSAECONNRESET	Windows Socket Error - Connection reset by peer. An existing connection was forcibly closed by the remote host. This normally results if the peer application on the remote host is suddenly stopped, the host is rebooted, the host or remote network interface is disabled, or the remote host uses a hard close (see setsockopt for more information on the SO_LINGER option on the remote socket). This error may also result if a connection was broken due to keep-alive activity detecting a failure while one or more operations are in progress. Operations that were in progress fail with WSAENETRESET. Subsequent operations fail with WSAECONNRESET.
RC_ERR_WSAENOBUFS	Windows Socket Error - No buffer space available. An operation on a socket could not be performed because the system lacked sufficient buffer space or because a queue was full.
RC_ERR_WSAEISCONN	Windows Socket Error - Socket is already connected. A connect request was made on an already-connected socket. Some implementations also return this error if sendto is called on a connected SOCK_DGRAM socket (for SOCK_STREAM sockets, the to parameter in sendto is ignored) although other implementations treat this as a legal occurrence.
RC_ERR_WSAENOTCONN	Windows Socket Error - Socket is not connected. A request to send or receive data was disallowed because the socket is not connected and (when sending on a datagram socket using sendto) no address was supplied. Any other type of operation might also return this error?for example, setsockopt setting SO_KEEPALIVE if the connection has been reset.
RC_ERR_WSAESHUTDOWN	Windows Socket Error - Cannot send after socket shutdown. A request to send or receive data was disallowed because the socket had already been shut down in that direction with a previous shutdown call. By calling shutdown a partial close of a socket is requested, which is a signal that sending or receiving, or both have been discontinued.
RC_ERR_WSAETOOMANYREFS	Windows Socket Error - Too many references. Too many references to some kernel object.
RC_ERR_WSAETIMEDOUT	Windows Socket Error - Connection timed out. A connection attempt failed because the connected party did not properly respond after a period of time, or the established connection failed because the connected host has failed to respond.
RC_ERR_WSAECONNREFUSED	Windows Socket Error - Connection refused. No connection could be made because the target computer actively refused it. This usually results from trying to connect to a service that is inactive on the foreign host?that is, one with no server application running.
RC_ERR_WSAELOOP	Windows Socket Error - Cannot translate a name.
RC_ERR_WSAENAMETOOLONG	Windows Socket Error - Name too long. A name component or a name was too long.
RC_ERR_WSAEHOSTDOWN	Windows Socket Error - Host is down. A socket operation failed because the destination host is down. A socket operation encountered a dead host. Networking activity on the local host has not been initiated. These conditions are more likely to be indicated by the error WSAETIMEDOUT.
RC_ERR_WSAEHOSTUNREACH	Windows Socket Error - No route to host. A socket operation was attempted to an unreachable host. See WSAENETUNREACH.
RC_ERR_WSAENOTEMPTY	Windows Socket Error - Directory not empty. Cannot remove a directory that is not empty.
RC_ERR_WSAEPROCLIM	Windows Socket Error - Too many processes. A Windows Sockets implementation may have a limit on the number of applications that can use it simultaneously. WSASStartup may fail with this error if the limit has been reached.
RC_ERR_WSAEUSERS	Windows Socket Error - User quota exceeded. Ran out of user quota.
RC_ERR_WSAEDQUOT	Windows Socket Error - Disk quota exceeded. Ran out of disk quota.
RC_ERR_WSAESTALE	Windows Socket Error - Stale file handle reference. The file handle reference is no longer available.
RC_ERR_WSAEREMOTE	Windows Socket Error - Item is remote. The item is not available locally.
RC_ERR_WSASYSNOTREADY	Windows Socket Error - Network subsystem is unavailable. This error is returned by WSASStartup if the Windows Sockets implementation cannot function at this time because the underlying system it uses to provide network services is currently unavailable.
RC_ERR_WSAVERNOTSUPPORTED	Windows Socket Error - Winsock.dll version out of range. The current Windows Sockets implementation does not support the Windows Sockets specification version requested by the application. Check that no old Windows Sockets DLL files are being accessed.
RC_ERR_WSANOTINITIALISED	Windows Socket Error - Successful WSASStartup not yet performed. Either the application has not called WSASStartup or WSASStartup failed. The application may be accessing a socket that the current active task does not own (that is, trying to share a socket between tasks), or WSACleanup has been called too many times.
RC_ERR_WSAEDISCON	Windows Socket Error - Graceful shutdown in progress. Returned by WSARcv and WSARcvFrom to indicate that the remote party has initiated a graceful shutdown sequence.
RC_ERR_WSAENOMORE	Windows Socket Error - No more results. No more results can be returned by the WSALookupServiceNext function.
RC_ERR_WSAECANCELLED	Windows Socket Error - Call has been canceled. A call to the WSALookupServiceEnd function was made while this call was still processing. The call has been canceled.
RC_ERR_WSAEINVALIDPROCTABLE	Windows Socket Error - Procedure call table is invalid. The service provider procedure call table is invalid. A service provider returned a bogus procedure table to Ws2_32.dll. This is usually caused by one or more of the function pointers being NULL.
RC_ERR_WSAEINVALIDPROVIDER	Windows Socket Error - Service provider is invalid. The requested service provider is invalid. This error is returned by the WSCGetProviderInfo and WSCGetProviderInfo32 functions if the protocol entry specified could not be found. This error is also returned if the service provider returned a version number other than 2.0.
RC_ERR_WSAEPROVIDERFAILEDINIT	Windows Socket Error - Service provider failed to initialize. The requested service provider could not be loaded or initialized. This error is returned if either a service provider's DLL could not be loaded (LoadLibrary failed) or the provider's WSPStartup or NSPStartup function failed.
RC_ERR_WSASYSCALLFAILURE	Windows Socket Error - System call failure. A system call that should never fail has failed. This is a generic error code, returned under various conditions.
RC_ERR_WSASERVICE_NOT_FOUND	Windows Socket Error - Service not found. No such service is known. The service cannot be found in the specified name space.
RC_ERR_WSATYPE_NOT_FOUND	Windows Socket Error - Class type not found. The specified class was not found.
RC_ERR_WSA_E_NO_MORE	Windows Socket Error - No more results. No more results can be returned by the WSALookupServiceNext function.
RC_ERR_WSA_E_CANCELLED	Windows Socket Error - Call was canceled. A call to the WSALookupServiceEnd function was made while this call was still processing. The call has been canceled.

RC_ERR_WSAEREFUSED	Windows Socket Error - Database query was refused. A database query failed because it was actively refused.
RC_ERR_WSAHOST_NOT_FOUND	Windows Socket Error - Host not found. No such host is known. The name is not an official host name or alias, or it cannot be found in the database(s) being queried. This error may also be returned for protocol and service queries, and means that the specified name could not be found in the relevant database.
RC_ERR_WSATRY_AGAIN	Windows Socket Error - Nonauthoritative host not found. This is usually a temporary error during host name resolution and means that the local server did not receive a response from an authoritative server. A retry at some time later may be successful.
RC_ERR_WSANO_RECOVERY	Windows Socket Error - This is a nonrecoverable error. This indicates that some sort of nonrecoverable error occurred during a database lookup. This may be because the database files (for example, BSD-compatible HOSTS, SERVICES, or PROTOCOLS files) could not be found, or a DNS request was returned by the server with a severe error.
RC_ERR_WSANO_DATA	Windows Socket Error - Valid name, no data record of requested type. The requested name is valid and was found in the database, but it does not have the correct associated data being resolved for. The usual example for this is a host name-to-address translation attempt (using gethostbyname or WSAAsyncGetHostByName) which uses the DNS (Domain Name Server). An MX record is returned but no A record?indicating the host itself exists, but is not directly reachable.
RC_ERR_WSA_QOS_RECEIVERS	Windows Socket Error - QoS receivers. At least one QoS reserve has arrived.
RC_ERR_WSA_QOS_SENDERS	Windows Socket Error - QoS senders. At least one QoS send path has arrived.
RC_ERR_WSA_QOS_NO_SENDERS	Windows Socket Error - No QoS senders. There are no QoS senders.
RC_ERR_WSA_QOS_NO_RECEIVERS	Windows Socket Error - QoS no receivers. There are no QoS receivers.
RC_ERR_WSA_QOS_REQUEST_CONFIRMED	Windows Socket Error - QoS request confirmed. The QoS reserve request has been confirmed.
RC_ERR_WSA_QOS_ADMISSION_FAILURE	Windows Socket Error - QoS admission error. A QoS error occurred due to lack of resources.
RC_ERR_WSA_QOS_POLICY_FAILURE	Windows Socket Error - QoS policy failure. The QoS request was rejected because the policy system couldn't allocate the requested resource within the existing policy.
RC_ERR_WSA_QOS_BAD_STYLE	Windows Socket Error - QoS bad style. An unknown or conflicting QoS style was encountered.
RC_ERR_WSA_QOS_BAD_OBJECT	Windows Socket Error - QoS bad object. A problem was encountered with some part of the filterspec or the provider-specific buffer in general.
RC_ERR_WSA_QOS_TRAFFIC_CTRL_ERROR	Windows Socket Error - QoS traffic control error. An error with the underlying traffic control (TC) API as the generic QoS request was converted for local enforcement by the TC API. This could be due to an out of memory error or to an internal QoS provider error.
RC_ERR_WSA_QOS_GENERIC_ERROR	Windows Socket Error - QoS generic error. A general QoS error.
RC_ERR_WSA_QOS_ESERVICETYPE	Windows Socket Error - QoS service type error. An invalid or unrecognized service type was found in the QoS flowspec.
RC_ERR_WSA_QOS_EFLOWSPEC	Windows Socket Error - QoS flowspec error. An invalid or inconsistent flowspec was found in the QoS structure.
RC_ERR_WSA_QOS_EPROVSPECBUF	Windows Socket Error - Invalid QoS provider buffer. An invalid QoS provider-specific buffer.
RC_ERR_WSA_QOS_EFILTERSTYLE	Windows Socket Error - Invalid QoS filter style. An invalid QoS filter style was used.
RC_ERR_WSA_QOS_EFILTERTYPE	Windows Socket Error - Invalid QoS filter type. An invalid QoS filter type was used.
RC_ERR_WSA_QOS_EFILTERCOUNT	Windows Socket Error - Incorrect QoS filter count. An incorrect number of QoS FILTERSPECS were specified in the FLOWDESCRIPTOR.
RC_ERR_WSA_QOS_EOBJLENGTH	Windows Socket Error - Invalid QoS object length. An object with an invalid ObjectLength field was specified in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_EFLOWCOUNT	Windows Socket Error - Incorrect QoS flow count. An incorrect number of flow descriptors was specified in the QoS structure.
RC_ERR_WSA_QOS_EUNKOWNPSOBJ	Windows Socket Error - Unrecognized QoS object. An unrecognized object was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_EPOLICYOBJ	Windows Socket Error - Invalid QoS policy object. An invalid policy object was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_EFLOWDESC	Windows Socket Error - Invalid QoS flow descriptor. An invalid QoS flow descriptor was found in the flow descriptor list.
RC_ERR_WSA_QOS_EPSFLOWSPEC	Windows Socket Error - Invalid QoS provider-specific flowspec. An invalid or inconsistent flowspec was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_EPSFILTERSPEC	Windows Socket Error - Invalid QoS provider-specific filterspec. An invalid FILTERSPEC was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_ESDMODEOBJ	Windows Socket Error - Invalid QoS shape discard mode object. An invalid shape discard mode object was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_ESHAPERATEOBJ	Windows Socket Error - Invalid QoS shaping rate object. An invalid shaping rate object was found in the QoS provider-specific buffer.
RC_ERR_WSA_QOS_RESERVED_PETYPE	Windows Socket Error - Reserved policy QoS element type. A reserved policy element was found in the QoS provider-specific buffer.

Appendix B - Automatic Retry

CenTran Programming Reference Manual

Auto retry for restoring a dropped connection to the transaction directory

The immediate older version of CenTran stops transaction processing when a connection to the input transaction folder is lost, if only for a short duration, due to network failure or other connection issues. CenTran displays a message in the progress report - 'Directory Monitor: Failed to update directory change notification! Stopped transaction processing'.

The current version of CenTran makes repeated attempts to reestablish connection with the input transaction folder and when it succeeds, resumes processing all the transactions stored in the input transaction folder. The attempts to reestablish connection with the input transaction folder are made every two seconds and each failed attempt is displayed in the progress report along with date and time (Example: 'Directory Monitor: Failed to update directory change notification! Another attempt will be made in 2 seconds. Current Date/Time: 2009/2/27 15:36:30').

CenTran's attempts to reestablish connection with the transaction folder can be stopped by simply clicking on the 'Stop' button in the toolbar (also used to stop processing transactions).

When CenTran is able to eventually reestablish a connection to the transaction folder, a message indicating success is displayed in the progress report (Example - 'Directory Monitor: Succeeded in updating directory change notification! Current Date/Time: 2009/2/27 15:36:52'). Then, CenTran resumes processing all the unread transactions in the transaction folder.

Auto retry for restoring a dropped connection to the database

The immediate older version of CenTran stops transaction processing when a remote connection to the database is lost, if only for a short duration, due to network failure. CenTran displays a message box saying that an error occurred while establishing a connection to the server.

The current version of CenTran makes repeated attempts to reestablish connection with the database and when it succeeds, resumes processing all the transactions. The attempts to reestablish connection with the database are made approximately every 15 seconds and each failed attempt is displayed in the progress report along with date and time (Example: 'Database Monitor: Failed to connect to database! Another attempt will be made in a few seconds. Current Date/Time: 2009/2/27 18:6:16').

CenTran's attempts to reestablish connection with the database can be stopped by simply clicking on the 'Stop' button in the toolbar (also used to stop processing transactions).

When the network resumes normal functioning, CenTran reestablishes a connection to the database and a message indicating success is displayed in the progress report (Example - 'Database Monitor: Succeeded in connecting to database! Current Date/Time: 2009/2/27 18:5:31'). Then, CenTran resumes processing all the unread transactions in the transaction folder.

Appendix C - Beta Expiration

CenTran Programming Reference Manual

The beta versions of CenTran, the ATM Agents and the Keybox Agents will be assigned an initial expiration date of 180 days after the date of creation by Kaba Mas.

When CenTran or an agent is within 60 days of its expiration date entries will be posted to the database audit log documenting the situation. CenTran and the agents will continue to function.

When CenTran expires an entry will be posted to the database audit log identifying the event. An expired CenTran will not process transaction requests but will return an error condition to the transaction requestor. An entry will be posted to the database audit log documenting the transaction that failed due to an expired CenTran.

In a future Beta release the customer will be provided with the ability to reset the expiration date, and the date on which the warnings begin, for CenTran and the Agents with help from Kaba Mas Technical Support.

CenTran 5.4.0.4378 XML Programming Reference Manual 28 Jun 2019

Appendix D - Legacy Binary File Transactions with Cencon Gen 2 Locks

CenTran Programming Reference Manual

Warning

Legacy binary file transactions, which were deprecated in CenTran Version 4.1.5, are no longer officially supported as of CenTran Version 5.1.0 and will be removed in a future release. Kaba Mas recommends that any use of the legacy binary file format be migrated to the XML file format as described in the CenTran Version 5 Programming Reference Manual.

CenTran 4.1.5 and higher will support dispatching, reassigning, and closing Cencon Gen 2 Locks using the CenTran legacy binary file format. This is accomplished by truncating strings that do not fit into the fields of the legacy binary file format. Lock serial numbers a million or higher will not fit into the fields of the legacy binary file format and will be replaced by 000000.

See the legacy CenTran Programming Guide for details on using the legacy binary file format with CenTran.

The legacy binary file transactions can be used to dispatch, reassign, and close Cencon Gen 2 locks by lock name as long as the lock name is 10 characters or less and does not contain any international characters.

The legacy binary file transactions can be used to dispatch, reassign, and close Cencon Gen 2 locks by lock serial number as long as the serial number is less than a million. If the lock serial number is a million or greater, then the Cencon Gen 2 lock can not be identified by serial number using the legacy binary file transactions. Cencon Gen 2 locks with a lock serial number a million or higher will have a serial number of 000000 returned in the legacy binary file transactions.

The four digit close seal used by Cencon Gen 2 locks is split between two fields of the legacy binary file transaction format. The first two digits is placed in the **Lock Close Seal Number** field. The second two digits is placed in the **Lock Close Seal Number Expansion** field. Both of these fields are three byte null terminated character fields. The four digit close seal must be formatted as four numeric characters, with two characters placed in the first field and two characters placed in the second field. (00 00 to 99 99)

The legacy binary file format fields vary depending on the operation. The legacy binary file format supports Cencon Gen 2 locks in the following manner for lock operations:

Field Name	Type	Size	Description
Sequence Number	short integer	2 Bytes	Sequence number if used in route
Call Type	short integer	2 Bytes	2 = 2nd line FLM call
Lock Audit Count	short integer	2 Bytes	Lock audit count
Lock Name	character	11 Bytes	Lock name up to 10 characters, null terminated.
Route Name	character	9 Bytes	Route name up to 8 characters, null terminated.
Cover Covert Entry Flag	character	1 Byte	Flag for Cencon lock cover covert entry.
Lock Serial Number	character	7 Bytes	Lock serial number up to 6 characters, null terminated. Serial numbers over a million for Cencon Gen 2 locks will be reported as 000000.
Dispatcher ID	character	21 Bytes	Dispatcher ID up to 20 characters, null terminated, used for authorization and auditing of the transaction.
FLM / Route User ID 1	character	21 Bytes	First FLM / Route user ID up to 20 characters, null terminated, used for lock dispatch and close.
FLM / Route User ID 2	character	21 Bytes	Second FLM / Route user ID up to 20 characters, null terminated, used for lock dispatch and close of dual mode locks.
Lock Combination 1	character	7 Bytes	Lock combination for first FLM / Route user. This will be 6 numeric characters. (000000 - 999999)
Lock Combination 2	character	7 Bytes	Lock combination for second FLM / Route user for dual mode locks. This will be 6 numeric characters. (000000 - 999999)
Lock Close Seal Number	character	3 Bytes	First two numeric characters for the lock close seal, null terminated. The Cencon Gen 1 locks have two digit close seals. The Cencon Gen 2 locks have four digit close seals, continued in the Lock Close Seal Number Expansion Field.
New FLM / Route User ID 1	character	21 Bytes	First FLM / Route user ID up to 20 characters, null terminated, used for lock reassign.
New FLM / Route User ID 2	character	21 Bytes	Second FLM / Route user ID up to 20 characters, null terminated, used for lock reassign of dual mode locks.
Nickname	character	11 Bytes	User nickname up to 10 characters, null terminated.
Absolute Sublock Authorization Data	N/A	16 Bytes	Sublocks are not longer supported by the Cencon system. These fields are ignored.
Lock Close Seal Number Expansion	character	3 Bytes	Second two numeric characters for the lock close seal, null terminated. The Cencon Gen 1 locks have two digit close seals. The Cencon Gen 2 locks have four digit close seals, continued in the Lock Close Seal Number Expansion Field.
Unused	N/A	15 Bytes	Unused space.

Cencon and CenTran support a minimum of 64 characters with internationalization for all string fields in the Cencon database. Any character fields in the legacy binary file transactions will be populated up to their smaller size limit, and any remaining character data will be truncated.

The legacy binary file transactions do not support internationalization. Any international characters can not be converted to single

byte characters for use in the legacy binary file transactions, and will potentially result in unreadable data.

Appendix E - Lock Audit Data

CenTran Programming Reference Manual

The following is an list of the fields used to store Cencon Gen 2 lock audits (with description) that CenTran could return. These values are valid for audits returned from CenTran with an audit event code of **ENV_LOCK_EVENT**. In the case of such audits, the audit data has been downloaded from a Cencon Gen 2 lock.

The Cencon Gen 2 lock audit codes are broken into three pieces of information: The lock transaction category, type, and event.

The fields Lock Transaction Category, Lock Transaction Type, and Lock Transaction Event make up the lock audit code describing the reason for the audit record.

There are additional audit fields that describe the characteristics of event that occurred at the lock.

Audit Record Field	Field Name	Description
EventType	Event Type	This is the identifier for the manner of audit event that occurred. For lock audits, this value will always be ENV_LOCK_EVENT . The specific manner of lock event is described by the fields downloaded from the lock.
EventResult	Event Result	This is the result error code associated with the audit event for an operation with Cencon / CenTran. For lock audits, this value is not applicable and will be 0.
EventDate	Event Date	This is the event date associated with the audit event. For lock audits, this value will be populated from the lock audit open time or close time, as appropriate for the manner of lock event.
PreviousDate	Previous Date	This is the previous date associated with the audit event. It is populated for audit events associated with setting the time on a legacy user key. For lock audits, this value is not applicable and will be blank.
LogonUser1ID	1st Logon User ID	This is the first logon user ID associated with the audit event. For lock audits, this value is not applicable and will be blank.
LogonUser2ID	2nd Logon User ID	This is the second logon user ID associated with the audit event. For lock audits, this value is not applicable and will be blank.
LogonUser3ID	3rd Logon User ID	This is the third logon user ID associated with the audit event. For lock audits, this value is not applicable and will be blank.
User1ID	1st User ID	This is the first user ID associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran based on the first user key serial number, and populated if the matching user record could be found. Not all lock audits have an associated user key serial number, so this field is populated based on the manner of lock audit event that occurred.
User2ID	2nd User ID	This is the second user ID associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran based on the second user key serial number for a dual user operation at the lock, and populated if the matching user record could be found. Not all lock audits have an associated user key serial number, so this field is populated based on the manner of lock audit event that occurred.
LockName	Lock Name	This is the lock name string of the lock associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
LockMode	Lock Mode	This is the lock mode of the lock associated with the audit event. For lock audits, this value should always be set. It is automatically set by Cencon / CenTran based on parsing the lock audit transaction category, type, and event.
RouteName	Route Name	This is the route name string for a Cencon / CenTran route operation associated with the audit event. For lock audits, this value is not applicable and will be blank.
CustomerID	Customer ID	This is the customer ID string of the lock associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
ATMSerialNumber	ATM Serial Number	This is the ATM serial number string of the lock associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
Region	Region	This is the region of the lock associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
SerialNumber	Lock Serial Number	This is the serial number of the lock associated with the audit event. For lock audits, this value should always be set. It is used by Cencon / CenTran to look up other associated data for the lock to be populated into the audit record.
BankBranchName	Bank Branch Name	This is the bank branch name of the lock associated with the audit event. This is applicable to bank mode locks only. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
BankUserID	Bank Mode User ID	This is the numeric bank mode user ID of the user associated with the audit event. This is applicable to bank mode users only. For lock audits, this value is set if the lock event had an associated bank mode user.
BankBranchID	Bank Branch ID	This is the numeric bank branch ID of the lock associated with the audit event. This is applicable to bank mode locks only. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.
GroupName	Group Name	This is the group name of the lock associated with the audit event. For lock audits, this value is automatically looked up by Cencon / CenTran, and populated if the matching lock record could be found.

Description	Text Description	This is a text description of the manner of event that caused the audit record to be recorded. This field is translated based on the contents of the resources/{language culture code}/ODBC_AuditEventTranslation.xml string table file under the Cencon / CenTran install directory. The language culture code is based on the language and culture set with the host operating system. If the string table file is not found, this will default to predefined strings for en-US and the string table file will automatically be created.
auditPK	Audit Primary Key	This is a unique identifier value for the audit record in the database. It is automatically generated by Cencon / CenTran. It is needed for unique database record identification to support hot database backups and database replication. It is not related to the other data in the audit record, other than being a unique identifier for the record.
User1Key	1st User Key Serial Number	First user key serial number associated with the audit event. For lock audits, this will be the user key serial number downloaded from the lock for the event. Not all lock audits have an associated user key serial number, so this field is populated based on the manner of lock audit event that occurred.
User2Key	2nd User Key Serial Number	Second user key serial number associated with the audit event. For lock audits, this will be the user key serial number downloaded from the lock for the event for locks in dual user mode. Not all lock audits have an associated user key serial number, so this field is populated based on the manner of lock audit event that occurred.
LogonKey	Dispatcher Logon Key	Dispatcher Logon Key responsible for the audit event. This is not applicable to lock audits.
LockTransactionCategory	Lock Audit Transaction Category	This is the overall category of lock audit. The specific event is defined under the category by the lock audit transaction type and event. This value is downloaded from the lock and parsed by Cencon / CenTran to determine the manner of lock audit that occurred.
LockTransactionType	Lock Audit Transaction Type	This is the type of lock audit event. This defines what possible event codes are applicable to describe the lock audit. This value is downloaded from the lock and parsed by Cencon / CenTran to determine the manner of lock audit that occurred.
LockTransactionEvent	Lock Audit Transaction Event	This is the specific event that occurred at the lock. The meaning of the event code is dependent on the given lock transaction category and type of event. This value is downloaded from the lock and parsed by Cencon / CenTran to determine the manner of lock audit that occurred.
LockCloseSeal	Lock Close Seal	This is the close seal from the lock. This is only valid depending on the lock audit transaction category, type, and event. See the IsLockCloseSealValid flag field. This value is downloaded from the lock.
LockFullSealCount	Lock Full Seal Count	This is the lock close seal count for the lock audit transaction, for the given lock mode. This value is downloaded from the lock.
IsLockClockBatteryIsLow	Is Lock Clock Battery Low flag	This flag indicates that the lock clock battery was low at the time of the lock audit transaction. This value is downloaded from the lock.
IsLockDuressComboUsed	Is Lock Duress Combination Used flag	This flag indicates that a combination indicating duress was entered at the time of the lock audit transaction. This value is downloaded from the lock.
IsLockCloseSealValid	Is Lock Close Seal Valid flag	This flag indicates that the lock close seal given in the lock audit is valid. This flag is automatically set by Cencon / CenTran based on parsing the lock audit transaction category, type, and event.
LockAbbreviatedDeviceID	Lock Abbreviated Device ID	This value is the abbreviated device ID for the Cencon USB Keybox used to set up the security information for the lock. It is used to track how the lock was activated. This value is downloaded from the lock.
LockOpenTime	Lock Open Time	This value is the lock open time in Coordinated Universal Time (UTC). This is the time the lock was opened. It is valid depending on the lock audit transaction category, type, and event. This value is downloaded from the lock.
LockCloseTime	Lock Close Time	This value is the lock close time in Coordinated Universal Time (UTC). This is the time the lock was closed. It is valid depending on the lock audit transaction category, type, and event. This value is downloaded from the lock.
IsPossibleLockErrorOrIntrusion	Is Possible Lock Error Or Intrusion flag	This flag indicates that a possible lock error or intrusion occurred at the lock at the time of the lock audit transaction. This flag is automatically set by Cencon / CenTran based on parsing the lock audit transaction category, type, and event.
LockAuditIndex	Lock Audit Index	This is a count of the lock audit index from the lock. This value may not be valid depending on the level of firmware at the lock. This is used to help determine which lock audits are already in the Cencon database and which are new audits from the lock. This value is downloaded from the lock.
DatabaseLockAuditIndex	Database Lock Audit Index	This is a count of the lock audits as they are stored in the Cencon database. This is a calculated value that may or may not match the lock audit index. This value combined with the lock serial number should be unique in the Cencon database for a specific audit record.
ClientIPAddress	Client IP Address	This is the client IP address that requested the CenTran transaction associated with the audit event. This value is not applicable for a lock audit and will be blank.
LockIPAddress	Lock IP Address	This is the lock IP address that was accessed for the CenTran transaction associated with the audit event. For lock audits, this value will automatically be set by Cencon / CenTran if the lock was accessed across a network to download the lock audits. If the lock was being accessed by a USB or serial connection for the audit event, this value will be blank.

The following is a table describing each possible lock audit transaction category returned in the Lock Audit Transaction Category field, with the associated type and event values:

Lock Transaction Category	Category Value	Description	
		Transaction matching the Cencon Gen 1 Lock or Cencon Gen 2 Lock. Possible Types:	
		Type Value	Description
		Lock Transaction Type. Possible Events:	
		Event Value	Description
		0x000 (0)	Lock back cover removed. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			Consecutive-Failed attempts limit. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			Can-type/Key-type/Lock Mode mismatch
			Silent alarm found 'ON' from last 'Open'
			Dual Mode/Same Key
			Key-type mismatch
			Could not get a 2 of 3 match of security data.
			Factory initialization record did not CRC and is corrupt.
			Bank User not found in Lock List.
			Last Audit record not an 'Open' Audit
			Attempt to EEPROM/TM write without Lock Initialization.
			'Time-Window' mismatch
			User is Out of their 'Time-Window'
			Covert Bolt movement. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			Next Audit record place holder
		Gen 1: 0x010 (16)	FLM User Transaction Type. Cencon/CenTran will automatically set lock mode to F for these events. Possible Events:

or	Gen 2: 0x090 (144)	Event Value	Description
		0x001 (1)	'Open-Only' Audit record. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
		0x002 (2)	'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event.
		0x003 (3)	'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event.
		0x005 (5)	Sublock 'Open-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
		0x006 (6)	Sublock 'Close-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event.
		0x007 (7)	Sublock 'Open/Close' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event.
		0x00B (11)	Retrieval of Close seal from a closed lock. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event.
		0x00C (12)	Covert Detected 'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
		0x00D (13)	Covert Detected 'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
		0x00E (14)	'Covert Entry Cleared' Audit record. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
Gen 1: 0x020 (32)		Route User Transaction Type. Cencon/CenTran will automatically set lock mode to R for these events. Possible Events:	

		or	Event Value	Description
Cencon Gen 1 or 2	0x0A0 (160)	Gen 2:	0x001 (1)	'Open-Only' Audit record. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
			0x002 (2)	'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event.
			0x003 (3)	'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event.
			0x005 (5)	Sublock 'Open-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
			0x006 (6)	Sublock 'Close-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
			0x007 (7)	Sublock 'Open/Close' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event.
			0x00B (11)	Retrieval of Close seal from a closed lock. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event.
			0x00C (12)	Covert Detected 'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time and close seal as a valid values for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
			0x00D (13)	Covert Detected 'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open time, close time and close seal as a valid values for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
			0x00E (14)	'Covert Entry Cleared' Audit record. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
			Bank User Transaction Type. Cencon/CenTran will automatically set lock mode to B for these events. Possible Events:	
		Gen 1:		

		0x030 (48)	Event Value	Description
		or		
		Gen 2:		
		0x0B0 (176)		
		0x001 (1)		'Open-Only' Audit record. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
		0x002 (2)		'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time as a valid value for this event.
		0x003 (3)		'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open and close times as a valid values for this event.
		0x004 (4)		'Change Combo' Audit record. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
		0x005 (5)		Subblock 'Open-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open time as a valid value for this event.
		0x006 (6)		Subblock 'Close-Only' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the close time as a valid value for this event.
		0x007 (7)		Subblock 'Open/Close' Audit record. No longer supported. Note - Cencon/CenTran will automatically set the open and close times as a valid values for this event.
		0x00B (11)		Verify Close Audit record. Note - Cencon/CenTran will automatically set the close time as a valid value for this event.
		0x00C (12)		Covert Detected 'Close-Only' Audit record. Note - Cencon/CenTran will automatically set the close time as a valid value for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
		0x00D (13)		Covert Detected 'Open/Close' Audit record. Note - Cencon/CenTran will automatically set the open and close times as a valid values for this event. Note - Cencon/CenTran will also automatically set the audit flag for possible lock error or intrusion.
		0x00E (14)		'Covert Entry Cleared' Audit record. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			Supervisor Transaction Type. Possible Events:	
			Event Value	Description
		0x004 (4)		'Change Combo' Audit record.
		0x005 (5)		'Audit Dump' Audit record.
		0x006 (6)		'Initialize an FLM Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
		0x007 (7)		'Initialize a Route Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x008 (8)		'Initialize a Bank Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
		0x009 (9)		'Shelve an FLM Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
		0x00A (10)		'Shelve a Route Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x00B (11)		'Shelve a Bank Lock mode' Audit record. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
		0x00C (12)		'Add Bank Users' Audit record. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
		0x00D (13)		'Delete Bank Users' Audit record. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			Factory Transaction Type. Possible Events:	
		0x050 (80)	Event Value	Description
			0x00F (15)	'SuperShelve a Lock' Audit record.
			EEPROM Error Transaction Type. Possible Events:	

		0x060 (96)	Event Value	Description
			0x000 (0)	Error Reading/Writing: CLD Seed Record (Cashbar).
			0x001 (1)	Error Reading: Housekeeping record.
			0x002 (2)	Error Writing: Housekeeping record.
			0x003 (3)	Error Reading: Customer Initialization record.
			0x004 (4)	Error Reading: Customer Initialization record.
			0x005 (5)	Error Reading: Error List record.
			0x006 (6)	Error Writing: Error List record.
			0x007 (7)	Error Reading: Seed/Master/Close/Seal record.
			0x008 (8)	Error Writing: Seed/Master/Close/Seal record.
			0x009 (9)	Error Reading: Bank User record.
			0x00A (10)	Error Writing: Bank User record.
			0x00B (11)	Error Reading: Audit record
			0x00C (12)	Error Writing: Audit record
			0x00D (13)	Error Reading/Writing: Delayed-Open data record.
			0x00E (14)	Error Reading/Writing: Lock-Out/Alarm Distribution Unit (ADU) record.
			0x00F (15)	Error Reading/Writing: Factory Initialization record (Cashbar).
		0x070 (112)	'Touch-Memory' iButton Key Error Transaction Type. Possible Events:	
			Event Value	Description
			0x000 (0)	Error Reading/Writing: AET record read or write
			0x001 (1)	Error Reading: Housekeeping record
			0x002 (2)	Error Writing: Housekeeping record
			0x003 (3)	Error Reading: Audit record
			0x004 (4)	Error Writing: Audit record
			0x005 (5)	Error Reading: Initialization/Shelve record 1
			0x006 (6)	Error Writing: Initialization/Shelve record 1
			0x007 (7)	Error Reading: Initialization record 2
			0x008 (8)	Error Reading: Alarm Distribution Unit (ADU) DS2407 Can-Type + Serial Number.
			0x009 (9)	Error Reading: Add/Delete User record.
			0x00A (10)	Error Writing: Add/Delete User record.
			0x00C (12)	Error Reading/Writing: CLD access record. (Cashbar)
			0x00D (13)	Error Reading: ROM's Can-Type & Serial Number.
			0x00E (14)	Error Reading/Writing: 'Time-Window' record.
			0x00F (15)	Error Reading: TIC Timer value (after 7 tries).
		0x080 (128)	Alarm Distribution Unit (ADU) Error Transaction Type. Possible Events:	
			Event Value	Description
			0x001 (1)	Error Reading: DS2407's Family-Type & Serial Number
			0x002 (2)	Error Reading: Lockout/Alarm Distribution Unit (ADU) EEPROM record
			0x003 (3)	Error Writing: Lockout/Alarm Distribution Unit (ADU) EEPROM record
Lock	0x90 (144)	Cencon Gen 2 lock transaction. Possible Types:		
		Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	Lock time set key used.
			0x001 (1)	Lock factory combination open.
			0x002 (2)	Lock factory combination changed.
			0x003 (3)	Lock clock unavailable for time windows. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x004 (4)	Error: Lock clock has been reset. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x005 (5)	Error: Touch Memory (iButton) key family code lookup failed.
			0x006 (6)	Error: Legacy generation 1 key not allowed for operation.
			0x007 (7)	Error: Lock clock has failed. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x008 (8)	Bolt extended in Factory/Shelved mode.
		Cencon Gen 2 FLM user transaction. Cencon/CenTran will automatically set lock mode to F for these events. Possible Types:		

FLM User	0x91 (145)	Type Value	Description	
			Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use.	
		0x000 (0)	Event Value	Description
			0x000 (0)	User resynchronize lock combination state.
			0x001 (1)	User daylight savings table changed.
Route User	0x92 (146)	Cencon Gen 2 Route user transaction. Cencon/CenTran will automatically set lock mode to R for these events. Possible Types:		
		Type Value	Description	
			Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use.	
		0x000 (0)	Event Value	Description
			0x000 (0)	User resynchronize lock combination state.
			0x001 (1)	User daylight savings table changed.
Bank User	0x93 (147)	Cencon Gen 2 Bank user transaction. Cencon/CenTran will automatically set lock mode to B for these events. Possible Types:		
		Type Value	Description	
			Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use.	
		0x000 (0)	Event Value	Description
			0x000 (0)	User resynchronize lock combination state.
			0x001 (1)	User daylight savings table changed.
Audit	0x94 (148)	Cencon Gen 2 Supervisor Audit Key transaction. Possible Types:		
		Type Value	Description	
			Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use.	
		0x000 (0)	Event Value	Description
			0x000 (0)	Supervisor audit key operation: Bank mode user table dump. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x001 (1)	Supervisor audit key operation: Update FLM lock mode activation from Gen 1 compatibility mode to full Gen 2 mode. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
			0x002 (2)	Supervisor audit key operation: Update Route lock mode activation from Gen 1 compatibility mode to full Gen 2 mode. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
			0x003 (3)	Supervisor audit key operation: Update Bank lock mode activation from Gen 1 compatibility mode to full Gen 2 mode. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
Factory Transaction	0x95 (149)	Cencon Gen 2 Factory Transaction.		
		Reserved For Future Use.		
EEPROM Error	0x96 (150)	Cencon Gen 2 EEPROM Error Transaction. Possible Types:		

	(150)	Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	EEPROM Memory Error: Audit abuse record read error. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x001 (1)	EEPROM Memory Error: Audit abuse record write error. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x002 (2)	EEPROM Memory Error: Time zone and daylight savings time data read error. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
0x003 (3)	EEPROM Memory Error: Time zone and daylight savings time data write error. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.			

Touch Memory (iButton Key) Error	0x97 (151)	Cencon Gen 2 Touch Memory (iButton Key) Error Transaction. Possible Types:		
		Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	Touch Memory (iButton) Error: Lock activation time zone daylight savings time record read error.
			0x001 (1)	Touch Memory (iButton) Error: User record write error.
0x002 (2)	Touch Memory (iButton) Error: Combination resynchronization data write error.			

Alarm Distribution Unit (ADU) Error	0x98 (152)	Cencon Gen 1 ADU Error Transaction.	
		The alarm distribution unit is not supported by Cencon Gen 2 lock. Reserved For Future Use. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.	

Interface Box Error	0x99 (153)	Cencon Gen 2 Lock Interface Box Error Transaction.	
		Reserved For Future Use.	

Cencon (Host PC)	0x9A (154)	Cencon Gen 2 Lock Host PC Error Transaction. Possible Types:		
		Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
		0x001 (1)	Event is a logon access to Cencon / CenTran software.	

Cencon Gen 2 Firmware Error	0x9B (155)	Cencon Gen 2 Lock Firmware Error Transaction. Possible Types:		
		Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
		0x000 (0)	Firmware Error: Invalid function parameter.	

		Cencon Gen 2 Lock External Sensor Error Transaction. Possible Types:	

Cencon Gen 2 Sensor Event	0x9C (156)	Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	Sensor Event: Door open while getting close seal. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x001 (1)	Sensor Event: Remote disable asserted. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x002 (2)	Sensor Event: Door sensor disconnected. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x003 (3)	Sensor Event: Bolt works extended sensor disconnected. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x004 (4)	Sensor Event: Unexpected door open. The door sensor indicates open while the bolt is still extended. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x005 (5)	Sensor Event: Unexpected bolt works retraction. The bolt works sensor indicates open while the bolt is still extended. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
			0x006 (6)	Sensor Event: Unexpected bolt retraction. The bolt was retracted possibly by not having been extended completely from the previous open. Note - Cencon/CenTran will automatically set the audit flag for possible lock error or intrusion.
Communications Default Endpoint	0x9D (157)	Cencon Gen 2 Lock Serial Communications Default Endpoint Operation. Possible Types:		
		Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	Clock Write.
			0x007 (7)	Activate FLM Mode. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
			0x008 (8)	Activate Route Mode. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
			0x009 (9)	Activate Bank Mode. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
		Communications Factory Endpoint	0x9E (158)	Cencon Gen 2 Lock Serial Communications Factory Endpoint Operation. Possible Types:
Type Value	Description			
0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:			
	Event Value			Description
	0x000 (0)			Clock Write.
	0x00B (11)			Kaba Mas Reset FLM Mode. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
	0x00C (12)			Kaba Mas Reset Route Mode. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
0x00D (13)	Kaba Mas Reset Bank Mode. Note - Cencon/CenTran will automatically set the lock mode as B for this event.			

Communications FLM Endpoint	0x9F (159)	Cencon Gen 2 Lock Serial Communications First Line Maintenance (FLM) Mode Endpoint Operation. Possible Types:	
		Type Value	Description
		Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
		Event Value	Description
		0x000 (0)	Clock Write. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
		0x003 (3)	FLM Mode: Time zone daylight savings time transition table write. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
		0x005 (5)	FLM Mode: Access configuration (Single/Dual) write. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
		0x006 (6)	FLM Mode: Confirm FLM mode dispatched call closed. Note - Cencon/CenTran will automatically set the lock mode as F for this event.
Communications Route Endpoint	0xA0 (160)	Cencon Gen 2 Lock Serial Communications Route Mode Endpoint Operation. Possible Types:	
		Type Value	Description
		Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
		Event Value	Description
		0x000 (0)	Clock Write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x003 (3)	Route Mode: Time zone daylight savings time transition table write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x005 (5)	Route Mode: Access configuration (Single/Dual) write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x006 (6)	Route Mode: Confirm Route mode dispatched call closed. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
Communications Bank Endpoint	0xA1 (161)	Cencon Gen 2 Lock Serial Communications Bank Mode Endpoint Operation. Possible Types:	
		Type Value	Description
		Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
		Event Value	Description
		0x000 (0)	Clock Write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x003 (3)	Bank Mode: Time zone daylight savings time transition table write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x005 (5)	Bank Mode: Access configuration (Single/Dual) write. Note - Cencon/CenTran will automatically set the lock mode as R for this event.
		0x006 (6)	Bank Mode: Confirm Bank mode dispatched call closed. Note - Cencon/CenTran will automatically set the lock mode as R for this event.

Bank Endpoint	(101)	Type Value	Description	
		0x000 (0)	Fixed Value of 0 For Transaction Type. Other Values Reserved For Future Use. Possible Events:	
			Event Value	Description
			0x000 (0)	Clock Write. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x001 (1)	Bank Mode: Users Added. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x002 (2)	Bank Mode: Users Deleted. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x003 (3)	Bank Mode: Time zone daylight savings time transition table write. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x004 (4)	Bank Mode: Time delay / open window write. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x005 (5)	Bank Mode: Access configuration (Single/Dual) write. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x006 (6)	Bank Mode: Confirm Bank mode lock open as closed. Note - Cencon/CenTran will automatically set the lock mode as B for this event.
			0x00A (10)	Shelve Bank Mode. Note - Cencon/CenTran will automatically set the lock mode as B for this event.

Appendix F - dormakaba Safe Locks Privacy Statement

CenTran Programming Reference Manual

1. Definitions

Controller

The legal entity that determines the purposes and means of the processing of Personal Data is considered to be the Controller (e.g., when processing an employee's Personal Data, the employer is considered to be the Controller). The key responsibility of a Controller is to be accountable, i.e. to take actions in line with GDPR, and to be able to explain the compliance with GDPR to data subjects and the Supervisory Authority.

dormakaba is not a Controller of Personal Data in relation to administration and operation of the dormakaba Safe Lock products.

Processor

dormakaba also does not process Personal Data, although dormakaba software does allow an organization to capture and process Personal Data.

Personal Data

According to the EU General Data Protection Regulation (GDPR), Personal Data is all information that relates, or at least may be related, to a natural person and thus allows conclusions to be drawn about their personality.

A natural person is considered to be identifiable if they can be identified directly or indirectly, in particular by association with an identifier such as a name, with an identification number, with location data, with an online identifier or with one or more special features.

Pseudonymized Data

Pseudonymisation enhances privacy by replacing most identifying fields within a data record by one or more artificial identifiers, or pseudonyms. There can be a single pseudonym for a collection of replaced fields or a pseudonym per replaced field.

Specifically, the GDPR defines pseudonymization as "the processing of Personal Data in such a way that the data can no longer be attributed to a specific data subject without the use of additional information." To pseudonymise a data set, the "additional information" must be "kept separately and subject to technical and organisational measures to ensure non-attribution to an identified or identifiable person."

2. Personal Data processed by dormakaba Safe Lock products

The dormakaba Safe Lock products process only minimal Personal Data to operate effectively and to provide the best user experience.

Personal Data:

The following Personal Data is stored as a part of a Software User record or Audit records:

dormakaba product	Personal Data processed	Where / how Personal Data are used
Axessor	User Name*	AS284 Management Software
	User Name*	AS274 Management Software & Audit
	PC Name / login ID	Lock Audit (logging remote access)
Paxos	User Name*	Lock Audit (track changes UserID to Name)
Cencon/CenTran	First Name* / Middle Name* / Last Name*	User Identification
		Software Audit records - User deletion entry

*Optional entries, that can be entered into the systems.

Pseudonymized Data:

Pseudonymized data may also be stored as a part of a Software User record or Audit record:

dormakaba product	Personal Data processed	Where / how Personal Data are used
Axxesor	User ID / Password	User Identification
Paxos	Transaction data of individual persons	History/access logs
Cencon/CenTran	Login and logout dates	Logging

The dormakaba Safe Lock products are designed that all personal and security relevant data is managed by the owner(s) of the software and the locks. Therefore, dormakaba does not hold any Personal Data.

3. How to Access & Control Your Personal Data

To comply with GDPR your lock system administrator representing the Controller can view, edit or delete Personal Data stored in the software databases (via the respective associated dormakaba software).

It lies in the Controller's responsibility to process requests for manipulation of Personal Data.

Audit records may contain Personal Data that cannot be removed for security reasons. For further information, contact the lock system administrator.

4. General Notice to End Users

dormakaba Safe Lock products holding Personal Data are intended for use by organizations and are administered to you by your organization. Your use of dormakaba Safe Lock products may be subject to your organization's policies, if any. If your organization is administering your use of dormakaba Safe Lock products, please direct your privacy inquiries to your lock system administrator. When you use support features, other users in your network may see some of your activity. dormakaba is not responsible for the privacy or security practices of our customers, which may differ from those set forth in this Privacy Statement.

5. Contacting dormakaba

If you contact us by email or a web page contact form, the information you provide will be stored for the purpose of processing your request and for possible follow-up questions. We will not transfer your Personal Data to any third party without your consent. We do not and never will sell your Personal Data to third parties.

The information you provided to us via email or consent form will be processed on the basis of your consent. You can withdraw your consent at any time. We will not continue any data processing based on such a withdrawal. However, the withdrawal of consent does not affect the lawfulness of processing based on consent before its withdrawal. In case your inquiry relates to concluding a contract or our support of any dormakaba products, processing of your Personal Data is also

based on the corresponding regulations of the GDPR.

Your Personal Data submitted by contact form or email will be retained by us until you ask us to delete your data, withdraw your consent or the purpose of the retention is achieved, e.g. your service request has been resolved, unless any applicable legal provisions, in particular according to German commercial or tax law, stipulate a longer retention period.

If you have any questions about the use of your personal information, please email data.protection@dormakaba.com.

6. Your rights

You have the following rights to the Controller of your Personal Data:

- Right of access
- Right to rectification or completion or erasure
- Right to restriction of processing
- Right to data portability
- Right to lodge a complaint with a regulatory authority
- Right to withdraw your consent at any time. The withdrawal of consent does not affect the lawfulness of processing based on consent before its withdrawal.

Please refer to the EU GDPR Information Portal or the official web site of the European (EU) Commission for the most recent legislation and documentation.
