CenTran Programming Reference Manual

dormakaba

dormakaba Welcome

dormakaba is the world's leading manufacturer and supplier of high security, electronic safe locks. Its complete line of self powered, battery, and mechanical locks meets virtually every safe lock requirement. dormakaba is dedicated to satisfying end-user needs for security, safety, and convenience. We welcome you to the world of dormakaba security and Cencon®.

Manual Conventions

CenTran Programming Reference Manual

The CenTran Reference Manual is a comprehensive guide that contains information on the procedures you need to work with Cencon locks. This manual provides detailed information on CenTran features and step-by-step procedures for using the software. Some conventions that are followed are:

- The Smart Keys needed for a particular operation will be shown beside the flowcharts that describe the operation.
- The screens shown in the manual that speak to inserting a key in a reader may depict either the use of the 4-port Key Reader in association with the PCI card or the 2-port USB Key Box.
- Input to the PC will be shown in **bold type**.
- The screen samples may not look exactly as they do on your system depending on which version of the Windows operating system you are using. Some samples in this document are from Windows XP and some are from Windows Vista.
- Highlighted items:

Note

Indicates a point to consider.

Helpful Hint

Indicates a technique or method that works well.

Caution

Indicates the need for care and caution to be observed during a procedure or process.

Warning

Indicates the possibility of loss of data or system integrity.

Before reading the CenTran Reference Manual, you should be familiar with basic Windows concepts and techniques. For detailed information, refer to your Windows documentation.

CenTran 5.4.0.4378 XML Programming Reference Manual 28 Jun 2019

1.1 Introduction - Cencon ATM Cash Vault Security System Product Overview

CenTran Programming Reference Manual

The Challenge

While the front of ATMs are accessed by customers with individual cards and PINs, the back of the ATM is often accessed by service personnel from multiple companies all using the same lock combination. Bank employees, cash replenishers, technical service reps, repair personnel all using the same combination to open an ATM safe poses a significant security risk.

The Solution

The Cencon ATM Cash Vault Security System from Kaba Mas is designed to combat insider theft from ATMs through the combined use of lock hardware, systems software and Smart Keys. The Cencon system offers total access control and accountability with its One Time Combination feature. The One Time Combination is dispatched from a central location and cannot be reused at a later date, thus eliminating temptation.

The Cencon ATM Cash Vault Security System allows locks located anywhere in the world to be controlled and monitored from one central location.

The central location consists of

- A database describing locks, lock administration personnel, lock service personnel, lock access details and history.
- Kaba Mas software that
 - Manages the creation and distribution of One Time Combinations(OTC).
 - Tracks the status of each lock and user.
 - Provides audit capability.
 - Can be used interactively by a human Dispatcher or programmatically by customer applications such as IVR or Web base interfaces.

The software provided by Kaba Mas consists of

- Cencon Interactive Application: Interactive Central Point of Control
 - Used to create, distribute, manage One Time Combinations (OTC).
- CenTran Service: Background Central Point of Control
 - Used by customer, 3rd party applications to create, distribute and manage OTCs.
- CenTran Web Services: Used by customer web applications to communicate with CenTran Service.
- CenTran Agent
 - Remote lock management: Allows CenTran Service to communicate with ATM lock, streamlining lock administration.
- Key Box Agent
 - Remote key management: Allows CenTran Service to communicate with remote key boxes, supporting decentralized lock personnel.

The Cencon ATM Cash Vault Security System supports three Modes of Operation:

FLM Mode

Designed for First Line Maintenance (FLM) personnel such as cash replenishers, technical service reps, repair personnel, the FLM mode of the Cencon lock permits the dispatch center to give a One Time Combination (OTC) for ATM lock access to a technician "on the fly." FLM personnel are each issued a Smart Key and call their dispatch center to request a One Time Combination. Once used, this combination will not function again, thus ensuring absolute access control. Once the Cencon unit is locked, a Close Seal code is displayed on the lock's LCD. Entering this Close Seal into the dispatch center's computer documents that the Cencon lock is locked and secure.

Route Mode

While permitting the same access control as FLM Mode, Route Mode additionally permits pre-defined routes for armored cash replenishers. Route personnel are each issued a Smart Key. A route of locks, along with an OTC for each lock on the route, may be assigned by a dispatch center permitting route personnel to access a series of locks without contacting their dispatch center at each individual lock. Route personnel can either call their dispatch center at the end of the shift to report the Close Seals, or the Close Seals can be read from the Smart Key by the Cencon software.

Bank Mode

Bank Mode is designed for bank personnel who may need access to the Cencon system lock but do not wish to operate through a dispatch center. Smart Keys and combinations are issued to bank personnel who may unlock the Cencon lock at any time. An internal audit trail tracks all activity of bank personnel just as it does for FLM and Route personnel. Kaba Mas Cencon software permits bank administrators to manage Bank Mode on site. Bank users may be added or deleted and audit trails may be downloaded from the lock.

High Level Overview of Cencon ATM Cash Vault Security System Component Architecture

The Cencon ATM Cash Vault Security System consists of several components whose method of use will vary depending on the business model of the supported enterprise. Presented here is a brief high level overview of the Cencon ATM Cash Vault Security System components.

Cencon ATM Cash Vault Security System Component Architecture

Cencon Database:

- Defines locks to be controlled, monitored and audited.
- Defines personnel allowed to access locks.
- Defines Personnel allowed to control access to locks.
- Contains access history for each lock.

Cencon Application:

- Interactive, graphical Windows application used to manage the Cencon Database contents.
- Requires a Cencon Key Box be attached to a USB port of the same computer.

CenTran Service:

- Available for use by customer applications to manage the Cencon Database contents.
- Applications communicate with the service via files or HTTP / Web Services.
- Runs in background as a Windows Service.

CenTran Web Services:

- Available for use by web applications to manage Cencon Database contents.

Customer Application Using CenTran Service Command File:

- The CenTran Service performs actions against the Cencon Database per commands imbedded in files.
- Results of those actions are reported in output files created by the CenTran Service.

Customer Application Using CenTran Web Services:

- The CenTran Service performs actions against the Cencon database per commands received via the CenTran Web Services.
- Results of those actions are reported to the customer application via the CenTran Web Services.

CenTran Agent:

- Allows CenTran Service to monitor lock in a real time manner.
- Runs on the ATM in the background as a Windows Service.

Key Box Agent:

- Allows CenTran Service access to Cencon Key Boxes on remote systems.
- Runs on remote Web Client systems in background as a Windows Service.

Customer Web Client:

- Customer developed web browser based user interface used to manage Cencon Database contents as well as Cencon Smart Keys via the CenTran Web Services.
- Can be located remotely.

Cencon ATM Cash Vault Security System Components and Business Processes

Examples of Business Processes Supported by Cencon ATM Cash Vault Security System Components:

1. FLM (First Line Maintenance) Operations with human Dispatcher:
 1. FLM personnel reaches ATM and contacts Dispatcher requesting OTC.
 2. Dispatcher generates OTC via Cencon interactive application, gives OTC to FLM personnel.
 3. FLM personnel opens and closes lock, recording the Close Seal.
 4. FLM personnel gives Close Seal to Dispatcher who enters it into Cencon database via Cencon interactive application.
2. Route Operations with human Dispatcher:
 1. Before starting route, Route personnel contacts Dispatcher and requests OTCs for each lock on route.
 2. Dispatcher generates OTCs via Cencon interactive application, gives OTCs to Route personnel.
 3. Route personnel opens and closes each lock on route, recording Close Seals.
 4. When the Route has been completed, the Close Seals are given to the Dispatcher who enters them into the Cencon database via Cencon interactive application.
3. FLM Operations with IVR (Interactive Voice Response) system:
 1. FLM personnel reaches ATM, calls IVR system and requests OTC.
 2. IVR system generates OTC via CenTran Command File interface and reports OTC to FLM person.
 3. FLM personnel opens and closes lock, recording the Close Seal.
 4. FLM personnel calls IVR system and enters Close Seal.
 5. IVR system records Close Seal in Cencon database via CenTran Command File interface.

Though business processes will vary between companies there are core lock management tasks that will be used in every enterprise such as:

- Create User and Initialize Smart Key
- Delete User
- Dispatch Lock
- Open / Close physical lock
- Close Lock in Cencon database
- Reassign Lock
- Audit Lock
- Audit Key
- Audit Cencon Database

The following lists describe for a few of the core lock management tasks one possible flow of control through the Cencon ATM Cash Vault Security System components.

Create User and Initialize Smart Key:

- Dispatcher ->
- Customer Web Client ->

- CenTran Web Services ->
- CenTran Service ->
- CenTran Web Services ->
- Key Box Agent (writes KEY) ->
- CenTran Service ->
- CenTran Web Services ->
- Customer Web Client

Note:

- Customer Web Client & Key Box Agent will probably be on same location but do not have to be
- Customer Web Client does NOT require a Keybox on the same system

Dispatch Lock(s):

- Dispatcher ->
- Customer Web Client ->
- CenTran Web Services ->
- CenTran Service ->
- Cencon Database ->
- CenTran Service ->
- CenTran Web Services ->
- Customer Web Client ->
- Dispatcher receives OTC
- Dispatcher transmits OTC to FLM/Route personnel

Lock is physically opened and closed:

- Service personnel calls Close Seal in to the Dispatcher who "Closes Lock" in the Cencon Database. The component flow is the same as that described for Dispatch Lock(s).
 - OR
- CenTran Agent Service on ATM uses CenTran Web Services to report Closure to CenTran Service and "Closes Lock" in the Cencon Database programmatically:
 - Lock is closed ->
 - CenTran Agent ->
 - CenTran Web Services ->
 - CenTran Service ->
 - Cencon Database ->
 - CenTran Service ->
 - CenTran Web Services ->
 - CenTran Agent

1.2 Introduction - CenTran Service Overview

CenTran Programming Reference Manual

CenTran is a service supporting the integration of Cencon software with customer business software and operations. To enable this type of integration, CenTran supports several forms of communications:

- XML File Transfer Communications
- REST XML Web Service Communications (HTTPS)
- REST JSON Web Service Communications (HTTPS)
- SOAP Web Service Communications (HTTPS)
- Local System Named Pipe Communications
- Legacy Binary File Format Transfer Communications (Deprecated)

Programming Previous CenTran Releases

CenTran 5 supports the fixed binary file format used in programming previous versions. The programming guide for the fixed binary file format is a separate document 2039.041CentranWinPgmGuideD.pdf which can be found in the CenTran Documents folder of the install CD. All the contents of that document are relevant to CenTran 5, excluding the 'Configuration Files' section.

The CenTran XML file format overcomes the disadvantages and restrictions of the fixed binary file format used in previous versions of CenTran and provides support for new features.

Support for the binary file format is deprecated. The binary file format does not support the size of longer lock serial numbers greater than 6 digits. The binary file format can not be used to dispatch or close Cencon Gen 2 locks with serial numbers over a million. All currently shipping Cencon Gen 2 locks will have a serial number longer than 6 digits.

CenTran is hosted on a server connected to a Cencon USB key box. Transactions are exchanged between the customer's program and the CenTran System via shared files, web service, or named pipe.

In the case of communications by file transfer, these files are created in a specific directory with a specific extension. The customer's system creates transactions in files with one extension, while a different extension is used for files containing response transactions created by CenTran. CenTran reads the incoming transaction file, then deletes the incoming transaction file and eventually creates an output transaction file in the specified output directory.

The content of each XML input and output (response) transaction varies (unlike the transaction format for binary files). The format for each transaction is specified in an XML schema provided with CenTran. The input transaction files must conform to the format specified in the given schema.

The different categories of transaction include Lock, Route, User, Customer, Activity Log, Authorization and Region transactions.

User authorization tables in the Cencon database allow for controlled access to program operations. The authorizations for a particular user are established by assigning a Role when the user is created using the Cencon 5 software. The specific tasks the user may perform are the Role Definitions which are associated with that Role. For more information on user authorizations, refer to the 'User Authorization' section of the Cencon Version 5 Reference Manual. If a dispatcher ID is presented in a transaction file, it will have its authorizations checked when doing an operation. If CenTran defaults to the specified dispatcher ID from the CenTran settings, that dispatcher ID will have authorizations checked when doing an operation.

The generic format of input and output transactions is discussed in sections 1.3. Sections 1.4, 1.5, and 1.6 have examples illustrating how the CenTran transaction processor can be used.

Important Note

The Cencon System allows the entry of personal data. Please consult [Appendix F - dormakaba Safe Locks Privacy Statement](#) to see how personal data may be used in this software.

1.3 Introduction - Generic Format of Transaction Input / Output with XML Content

CenTran Programming Reference Manual

Generic Format of Transaction Input with XML Content

The input transactions which have XML content in them should conform to the format specified in the given schema.

- Most of the transactions have a format where the input elements (xml elements of the input transaction file) are listed sequentially in the order specified in the schema.
- In the case of route transactions, if multiple route locks need to be processed (for tasks like addition, deletion, dispatching, reassigning, closing), each route lock has to be specified according to the format for a route lock record in the schema. The exception to this rule is when all the locks on a route have to be dispatched or reassigned and in this case it is enough if CenTran is given only the route name. The route locks are processed by CenTran in the order in which they are listed in the input file.
- In the case of transactions which update a table with information supplied in the input file, only those fields of the table corresponding to elements present in the input transaction file are updated and the rest of the fields are not changed.
- In the case of query transactions (transactions which query a table based on a search condition), the query records can have the input elements in any order. Those input elements which do not contribute to the search query can be left out from the query record. In the case of query transactions (transactions which query a table based on a search condition), the query records can have the input elements in any order. Those input elements which do not contribute to the search query can be left out of the query record.
- All the transactions require a Dispatcher ID to be specified in the input file. If the ID is left blank, then the default dispatcher ID specified in the CenTran registry will be used instead.

Example of an Input Transaction with XML Content

```
<?xml version="1.0" encoding="utf-8"?>
<CentranXMLScript xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
  <TRANSACTION_DISPATCH_LOCK>
    <LockName>VLK009</LockName>
    <LockMode>F</LockMode>
    <User1ID>fjrb1</User1ID>
    <User2ID />
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_LOCK>
</CentranXMLScript>
```

1.4 Generic Format of Output Transactions with XML Content

The output transactions which have xml content in them should also conform to the format specified in the given schema.

- If the input transaction does not conform or cannot be validated against the format specified in the schema, CenTran returns an output transaction with the details of the validation errors.
- All the output transactions have the input transaction, followed by a result record indicating success or failure. The result record has:
 - A result element - "Success" or "Failure".
 - An error code (an extensive but not exhaustive list can be found in Appendix A). The error code for a completely successful transaction is always RC_OK.
 - A brief description of the result.
- After the result record, if the transaction has succeeded, there could be data from one or more records retrieved from the database/route file or there could be specific pieces of information that were requested by the dispatcher of the transaction.

For example, if a lock dispatch has succeeded, the database record of the lock which has been dispatched is retrieved and appended to the output file after the result record. Multiple records may be retrieved when a query transaction is processed and all the records matching the search condition is retrieved. In the case of a transaction in which only the count of a query (the number of records that match the search condition of the query) is needed, only that information is retrieved and appended after the result record.

- If a transaction has failed, there may or may not be extra information provided at the end of a result record, depending on the type of transaction.
- In the route transactions involving the processing of multiple route locks, each route lock has a result record indicating success or failure with error code and description for that particular route lock. There is also a result record containing the overall result for the transaction, which could be complete success (all route locks were processed successfully), partial success (only some route locks were processed successfully) or complete failure (no route locks were processed successfully).
- Some records retrieved from the database may leave out sensitive (Base Combo fields, Master Combo fields, Lock Communications Key, Encrypted Password fields) or unnecessary fields (Sublock fields).

Example of an Output Transaction with XML Content

```
<?xml version="1.0" encoding="utf-8"?>
<CentranXMLScript xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
  <!--Kaba Mas CenTran Response to TRANSACTION_DISPATCH_LOCK-->
  <RESPONSE_DISPATCH_LOCK>
    <TRANSACTION_DISPATCH_LOCK>
      <LockName>VLK009</LockName>
      <LockMode>F</LockMode>
      <User1ID>fjrb1</User1ID>
      <User2ID />
      <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_DISPATCH_LOCK>
```

```

<ResultRecord>
  <Result>Success</Result>
  <ErrorCode>RC_OK</ErrorCode>
  <Description>The lock dispatch succeeded.</Description>
</ResultRecord>

1.4 Introduction - Version Example

CenTran Programming Reference Manual

The following example illustrates how you would request the CenTran version information:

```
<CentranXMLScript>
  <TRANSACTION_VERSION>
</TRANSACTION_VERSION>
</CentranXMLScript>
```

The following example is what the response from CenTran for version information looks like:

```
<CentranXMLScript>
  <RESPONSE_VERSION>
    <ProductName>Centran</ProductName>
    <Version>4.1.5.2621</Version>
    <MajorVersionNumber>4</MajorVersionNumber>
    <MinorVersionNumber>1</MinorVersionNumber>
    <MaintenanceVersionNumber>5</MaintenanceVersionNumber>
    <BuildVersionNumber>2621</BuildVersionNumber>
    <ServerDateTimeUTC>2012-04-18T14:23:55.518Z</ServerDateTimeUTC>
    <ServerDateTimeLocal>2012-04-18T10:23:55.518-04:00</ServerDateTimeLocal>
    <ServerTimeZoneBias>-240</ServerTimeZoneBias>
  </RESPONSE_VERSION>
</CentranXMLScript>
```

1.5 Introduction - Dispatch Example

CenTran Programming Reference Manual

The following example illustrates how you would use the transaction processor to obtain the combination to open a lock. This transaction would be the same as choosing the "Dispatch Lock" option on the Cencon 5 Dispatching System. The example takes the lock name, lock mode, dispatcher ID, FLM/RSP ID values and processes them to create a transaction that matches the format specified in the XML schema.

The response transaction from CenTran will have the original input transaction followed by a result record and the lock record retrieved from the database after lock dispatch. The lock record will have the combinations to be used for opening the lock.

The example is in C++, using the .NET library.

Sample Code for Dispatching a Lock

```
// Get Lock name, Mode, User IDs, Dispatcher
System::String^ strLockName = "VLK016";
System::String^ strLockMode = "R";
System::String^ strUser1ID = "rjrb1";
System::String^ strUser2ID = "rjrb2";
System::String^ strDispatcherID = "CentranSS";

// Dispatch lock transaction - XML format
System::String^ strTransaction =
    "<TRANSACTION_DISPATCH_LOCK>" +
    "<LockName></LockName>" +
    "<LockMode></LockMode>" +
    "<User1ID></User1ID>" +
    "<User2ID></User2ID>" +
    "<DispatcherID></DispatcherID>" +
    "</TRANSACTION_DISPATCH_LOCK>";

// Insert Lock name, Mode, User IDs, Dispatcher values
strTransaction = strTransaction->Replace("<LockName></LockName>", "<LockName>" + strLockName + "</LockName>");
strTransaction = strTransaction->Replace("<LockMode></LockMode>", "<LockMode>" + strLockMode + "</LockMode>");
strTransaction = strTransaction->Replace("<User1ID></User1ID>", "<User1ID>" + strUser1ID + "</User1ID>");
strTransaction = strTransaction->Replace("<User2ID></User2ID>", "<User2ID>" + strUser2ID + "</User2ID>");
strTransaction = strTransaction->Replace("<DispatcherID></DispatcherID>", "<DispatcherID>" + strDispatcherID + "");

// Create XML Writer for the given input file
System::Xml::XmlWriter^ writer = System::Xml::XmlWriter::Create("C:\\CentranInput\\t07d.Tip");

// Write XML declaration
writer->WriteStartDocument();

// First element is always CentranXMLScript
strTransaction = "<CentranXMLScript xmlns='http://www.kaba-mas.com/CentranTransac.xsd'>" + strTransaction +
    "</CentranXMLScript>";

// Load XML Document from transaction string
document->LoadXml(strTransaction->Trim());

// Save the document to centran's input file
document->Save(writer);
// XML declaration
writer->WriteEndDocument();

// Flush buffer and close writer.
writer->Flush();
writer->Close();
.
.
/*Wait here for new file to appear
*/
.
.

// Create XmlReader reader for new file 'xmlFile'.
// settings (of type XmlReaderSettings) can be used to validate xmlFile against the
// given schema.
System::Xml::XmlReader^ reader = XmlReader::Create(xmlFile, settings);

// Load xml file to xml document
document->Load(reader);

// Close xml reader
reader->Close();

// Navigate document to 'ResultRecord' node (the node whose children contain the details of the result of the transaction)

// Then check if Success and get combination 1 and combination 2
if (result_node->FirstChild->InnerText == "Success")
{
    //Get combinations as strings
    System::Xml::XmlNodeList^ xlist1 = document->GetElementsByTagName("IssuedComboUser1Seq1");
    System::String^ strCombo1 = xlist1->Item(0)->ChildNodes[0]->Value->Trim();
    System::Xml::XmlNodeList^ xlist2 = document->GetElementsByTagName("IssuedComboUser2Seq1");
    System::String^ strCombo2 = xlist2->Item(0)->ChildNodes[0]->Value->Trim();
}
```

1.6 Introduction - Close Locks on Route Example

CenTran Programming Reference Manual

The next example illustrates how you might close a dispatched route. In this example, a transaction is posted requesting a list of all the locks on a route. Then, all the open locks are determined from the list based on the Open Time and Close Time of each lock. These names are then displayed to the operator and the appropriate close seals are entered and placed in the transaction record. A close transaction with multiple route lock records is then sent to CenTran to close the open locks on the route. Note that you do not have to query the open locks in the system in order to try to close them. You may keep track of what locks are open and simply post the close route transaction supplying the route lock records yourself.

The example is in C++, using the .NET library.

Sample Code for Closing Locks on Route

```
// Read locks on a route
// Get Route name, Dispatcher
System::String^ strRouteName = "TestRte4";
System::String^ strDispatcherID = "CentranSS";

// Read route transaction - XML format
System::String^ strTransaction =
    "<TRANSACTION_READ_ROUTE >" +
    "<RouteName></RouteName>" +
    "<DispatcherID></DispatcherID>" +
    "</TRANSACTION_READ_ROUTE >";

// Insert Route name, Dispatcher values
strTransaction = strTransaction->Replace("<RouteName></RouteName>", "<RouteName>" + strRouteName +
    "</RouteName>");
strTransaction = strTransaction->Replace("<DispatcherID></DispatcherID>", "<DispatcherID>" + strDispatcherID +
    "</DispatcherID>");

// Create XML Writer
System::Xml::XmlWriter^ writer = System::Xml::XmlWriter::Create("C:\\CentranInput\\ t07d.Tip);

// Write XML declaration
writer->WriteStartDocument();

// First element is always CentranXMLScript
strTransaction = "<CentranXMLScript xmlns='http://www.kaba-mas.com/CentranTransac.xsd'>" + strTransaction +
    "</CentranXMLScript>";

// Load XML Document from transaction string
document->LoadXml(strTransaction->Trim());

// Save the document to centran input file
document->Save(writer);

// XML declaration
writer->WriteEndDocument();

// Flush buffer and close writer.
writer->Flush();
writer->Close();

.
.
/*Wait here for new file to appear
*/
.
.

// Create XmlReader reader for new file xmlFile.
// settings (of type XmlReaderSettings) can be used to validate xmlFile against the
// given schema.
System::Xml::XmlReader^ reader = XmlReader::Create(xmlFile, settings);

// Load xml file to xml document
document->Load(reader);

// Close xml reader
reader->Close();

// Get list of route lock records
System::Xml::XmlNodeList^ xlist = document->GetElementsByTagName("RouteLockRecord");

// Navigate route lock records to find those that are open
// Add open route locks to RouteLockNodeArray
System::Collections::Generic::List ^ RouteLockNodeArray;
for each (XmlNode^ route_lock_node in xlist)
{
    // If route lock record has an open time that is not null but close time that is
    // null (null value for date is displayed as 0001-01-01T00:00:00)
    if ((route_lock_node->ChildNodes[4]->InnerText != "0001-01-01T00:00:00")
        && (route_lock_node->ChildNodes[5]->InnerText == "0001-01-01T00:00:00"))
    {
        RouteLockNodeArray->Add(route_lock_node);
    }
}

.
.
.
/*Show the locks to the operator, get close seals, and
Build the "Close locks on route" transaction string with seals */
```

```

.
.

// Convert close seals into strings and add them to a string array strCloseSealArray

System::String^ strTransaction =
    "<TRANSACTION_CLOSE_LOCKS_ROUTE>" +
    "<RouteName>" + strRouteName + "</RouteName>";

// For each route lock, add a Close route lock record element
for each (int i = 0; i < RouteLockNodeArray->Count; i++)
{
    XmlNode^ route_lock_node = RouteLockNodeArray.get()[i];

    System::String^ strLockName = route_lock_node->FirstChild->InnerText;
    System::String^ strLockSeq = route_lock_node->ChildNodes[6] ->InnerText;

    System::String^ strCloseRouteLock =
        "<CloseRouteLockRecord>" +
        "<LockName></LockName>" +
        "<LockSequence></LockSequence>" +
        "<CloseSeal></CloseSeal>" +
        "<IfForcedClosed>0</IfForcedClosed>" +
        "</CloseRouteLockRecord>";

    // Insert Lock name, sequence and close seal
    strCloseRouteLock = strCloseRouteLock->Replace(
        "<LockName></LockName>",
        "<LockName>" + strLockName + "</LockName>");

    strCloseRouteLock = strCloseRouteLock->Replace(
        "<LockSequence></LockSequence>",
        "<LockSequence>" + strLockSeq + "</LockSequence>");

    strCloseRouteLock = strCloseRouteLock->Replace(
        "<CloseSeal></CloseSeal>",
        "<CloseSeal>" + strCloseSealArray[i] + "</CloseSeal>");

    strTransaction = strTransaction + strCloseRouteLock;
}

strTransaction = strTransaction + "<DispatcherID>" + strDispatcherID + "</DispatcherID>";

strTransaction = strTransaction + "</TRANSACTION_CLOSE_LOCKS_ROUTE>";

// Create XML Writer
System::Xml::XmlWriter^ writer = System::Xml::XmlWriter::Create("C:\CentranInput\t07d.Tip");

// Write XML declaration
writer->WriteStartDocument();

// First element is always CentranXMLScript
strTransaction = "<CentranXMLScript xmlns='http://www.kaba-mas.com/CentranTransac.xsd'>" + strTransaction +
    "</CentranXMLScript>"

// Load XML Document from transaction string
document->LoadXml(strTransaction->Trim());

// Save the document to centran input file
document->Save(writer);

// XML declaration
writer->WriteEndDocument();

// Flush buffer and close writer.
writer->Flush();
writer->Close();

.
.
/*Wait here for new file to appear
*/
.
.

// Create XmlReader reader for new file xmlFile.
// settings (of type XmlReaderSettings) can be used to validate xmlFile against the given schema.
System::Xml::XmlReader^ reader = XmlReader::Create(xmlFile, settings);

// Load xml file to xml document
document->Load(reader);

// Close xml reader
reader->Close();

// Get list of result records
System::Xml::XmlNodeList^ ResultRecordNodeArray =
    document->GetElementsByTagName("ResultRecord");

for each (XmlNode^ result_node in ResultRecordNodeArray)
{
    // Print result from each result node
    // There is a result node for the overall transaction and each route lock
    print_result_message(result_node);
}

```

2.1.1 CenTran Status XML File Transactions - Version

CenTran Status XML File Transactions

This transaction is used to read the CenTran version and current server time.

Transaction information required:

- No information required.

Transaction information returned:

Success:

- Product name
- Version
- Major version number
- Minor version number
- Maintenance version number
- Build version number
- Server date and time based off of UTC
- Server date and time based off of Local Time
- Server time zone bias in minutes

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction:

```
<TRANSACTION_VERSION />
```

Output Transaction:

```
<RESPONSE_VERSION>
  <ProductName>Centran</ProductName>
  <Version>4.1.5.2621</Version>
  <MajorVersionNumber>4</MajorVersionNumber>
  <MinorVersionNumber>1</MinorVersionNumber>
  <MaintenanceVersionNumber>5</MaintenanceVersionNumber>
  <BuildVersionNumber>2621</BuildVersionNumber>
  <ServerDateTimeUTC>2012-04-16T16:25:11.1464266Z</ServerDateTimeUTC>
  <ServerDateTimeLocal>2012-04-16T12:25:11.1464266-04:00</ServerDateTimeLocal>
  <ServerTimeZoneBias>-240</ServerTimeZoneBias>
</RESPONSE_VERSION>
```

2.1.2 CenTran Status XML File Transactions - Available Time Zones

CenTran Status XML File Transactions

This transaction is used to read the CenTran server available time zone information.

Transaction information required:

- No information required.

Transaction information returned:

Success:

- ServerDateTimeUTC - Server Data / Time based on UTC (Coordinated Universal Time).
- ServerDateTimeLocal - Server Data / Time based on Server Local Time Zone.
- ServerTimeZoneBias - Server time zone bias in minutes. (This value can be positive or negative.)
- ServerTimeZoneID - Server time zone ID. This value is a unique identifier for the time zone the server has assigned.
- TimeZoneRecord - This is an array of zero or more records describing the time zone information available on the server.

TimeZoneRecord:

- TimeZoneBias - This is the time zone bias in minutes from the time zone local time to UTC. (Integer)
- TimeZoneDaylightName - This is the time zone name for daylight savings time. (String)
- TimeZoneDisplayName - This is the display name for the time zone. (String)
- TimeZoneID - This is a unique identifier for the time zone. This value is used with CenTran transactions to identify the time zone to use. (String)
- TimeZoneStandardName - This is the time zone name for standard time. (String)
- IfSupportsDaylightSavingTime - This boolean value is set to true if the time zone supports daylight savings time. (Boolean)

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction:

```
<TRANSACTION_AVAILABLE_TIME_ZONE_QUERY />
```

Output Transaction:

```
<CentranXMLScript>
  <RESPONSE_AVAILABLE_TIME_ZONE_QUERY>
    <ServerDateTimeUTC>2015-04-20T13:19:51.4037356Z</ServerDateTimeUTC>

2.2.1 Lock XML File Transactions - Dispatch Lock

CenTran Programming Reference Manual

This transaction dispatches or assigns an FLM mode lock, or dispatches a Route mode lock. The User ID(s) supplied here must be of the same type as the lock mode being dispatched. That is, if dispatching a call for an "F" lock mode, the ID(s) would be for FLM(s). If dispatching a call for an "R" lock mode, the ID(s) would be for RSPs. Also, if dispatching an "F" lock mode, you may specify that this is a second line maintenance call. A value of "1" or "true" in the "IfSecondLineMaintenance" field indicates a second line maintenance call.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to be dispatched.
- Lock Mode - The mode of the lock to be dispatched.
- 1st FLM/Route User ID
- 2nd FLM/Route User ID - If lock is not in dual mode, this field's value can be left blank.
- If Second Line Maintenance Call - Specifies if this is a second line maintenance call.
- Dispatcher ID (Optional) - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire lock record including last dispatch and combination(s).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock is already open.
- Invalid FLM / Route User(s).
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Invalid record type - the lock is not in Active or Install or Pending Shelve modes.
- Group ID mismatch - FLM/RSP not authorized to open the lock.
- User1 ID or User2 ID not found.
- User ID is not a field ID (i.e. ID is a Dispatcher, Supervisor, etc.)
- Dual mode - user time window mismatch (one user has time windows, one user does not).
- User 1 ID and User 2 ID are the same.
- User 1 ID or User 2 is not the same mode as the lock.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_DISPATCH_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>R</LockMode>
  <!-- 1st FLM/RSP ID-->
  <User1ID>rjrb1</User1ID>
  <!-- 2nd FLM/RSP ID -->
  <User2ID>rjrb2</User2ID>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DISPATCH_LOCK), a result record (indicating success) and the lock record retrieved after lock dispatch. The lock record includes information on the last dispatch and combination. Any lock record retrieved from CenTran always excludes sensitive fields like the Base Combo fields, Master Combo fields, Lock Communications Key etc.

Note: The returned combinations are in fields IssuedComboUser1Seq1 and IssuedComboUser2Seq1 of the lock record.

```
<RESPONSE_DISPATCH_LOCK>

  </LockRecord>
</RESPONSE_DISPATCH_LOCK>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_DISPATCH_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>R</LockMode>
  <!-- 1st FLM/RSP ID-->
  <User1ID>rjrb1</User1ID>
  <!-- 2nd FLM/RSP ID -->
  <User2ID>rjrb2</User2ID>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_LOCK>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DISPATCH_LOCK), a result record indicating failure with an error code (RC_ERR_LOCK_ALREADY_OPEN) and description.

```

<RESPONSE_DISPATCH_LOCK>
  <TRANSACTION_DISPATCH_LOCK xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <LockName>VLK016</LockName>
    <LockMode>R</LockMode>
    <User1ID>rjrb1</User1ID>
    <User2ID>rjrb2</User2ID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_LOCK>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_LOCK_ALREADY_OPEN</ErrorCode>
    <Description>The lock is already open. You can not dispatch to an already open lock.
      You may want to reassign the users already dispatched to the lock.</Description>
  </ResultRecord>
</RESPONSE_DISPATCH_LOCK>

```

Example 3 (Result = Failure)

Input Transaction:

```

<TRANSACTION_DISPATCH_LOCK>
  <!-- char string -->
  <LockName>123456789012345678901234567890123456789012345678901234567890
123456789012345</LockName>
  <!-- char string -->
  <LockMode>T</LockMode>
  <!-- char string -->
  <User1ID>fjrb1</User1ID>
  <!-- char string -->
  <User2ID></User2ID>
  <!--boolean-->
  <IfSecondLineMaintenanceCall>0</IfSecondLineMaintenanceCall>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_LOCK>

```

Output Transaction:

Here the input transaction has elements with values that do not conform to the restrictions imposed on those values by the XML schema. This causes some validation errors and CenTran returns the appropriate error code (RC_ERR_FAILED_VALIDATE_FILE) and a description of those validation errors (lock name exceeds 64 characters and value "T" is invalid for lock mode).

```

<RESPONSE_DISPATCH_LOCK>
  <TRANSACTION_DISPATCH_LOCK xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

2.2.2 Lock XML File Transactions - Reassign Lock

CenTran Programming Reference Manual

This function reassigns or assigns an outstanding call on a single lock (in FLM/Route mode) to a different FLM or RSP. This transaction corresponds to the "Reassign" option on the Operations menu of a lock report in the CENCON Dispatching System. It is used when an FLM or RSP has a combination to open a lock but cannot make the call for some reason. A new combination is issued to the new FLM or RSP.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to be reassigned.
- Lock Mode - The mode of the lock to be reassigned.
- 1st FLM/Route User ID
- 2nd FLM/Route User ID - If lock is not in dual mode, this field's value can be left blank.
- Lock Sequence (Optional) - If the lock has been dispatched on a route, then a valid lock sequence must be specified. In case of an FLM mode lock or a Route mode lock not dispatched on a route, this field can be left out.
- Dispatcher ID (Optional) - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire lock record including last dispatch and combination(s).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock is not open.
- Invalid FLM/Route User(s).
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Group ID mismatch - FLM/RSP not authorized to open the lock.
- User1 ID or User2 ID not found.
- User ID is not a field ID (i.e. ID is a Dispatcher, Supervisor, etc.)
- Dual mode - user time window mismatch (one user has time windows, one user does not).
- User 1 ID and User 2 ID are the same.
- User 1 ID or User 2 is not the same mode as the lock.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION REASSIGN_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>R</LockMode>
  <!-- 1st FLM/RSP ID-->
  <User1ID>rjrb1</User1ID>
  <!-- 2nd FLM/RSP ID -->
  <User2ID>rjrb2</User2ID>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_REASSIGN_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_REASSIGN_LOCK), a result record (indicating success) and the lock record retrieved after lock has been reassigned.

Note: The returned combinations are in fields IssuedComboUser1Seq1 and IssuedComboUser2Seq1 of the lock record.

```

  </Description>
  </ResultRecord>
</RESPONSE_REASSIGN_LOCK>
```

2.2.3 Lock XML File Transactions - Unassign Lock

CenTran Programming Reference Manual

This transaction unassigns one or both users from an FLM mode lock. This option is designed for use when a user has accidentally been dispatched to the wrong lock and must be freed up to service the correct lock.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to which the users are currently assigned.
- Lock Mode (must be FLM).
- Dispatcher ID (Optional) - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the unassigned lock record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock is not open.
- Lock is already unassigned.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UNASSIGN_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>F</LockMode>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UNASSIGN_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UNASSIGN_LOCK), a result record (indicating success) and the lock record retrieved after the lock has been unassigned.

```
<RESPONSE_UNASSIGN_LOCK>
  <TRANSACTION_UNASSIGN_LOCK xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

    <Description>The lock unassign failed. Lock not open.</Description>
  </ResultRecord>
</RESPONSE_UNASSIGN_LOCK>
```

2.2.4 Lock XML File Transactions - Close Lock

CenTran Programming Reference Manual

This transaction is used to enter a close seal to close an FLM or Route mode lock. There is also an option to force close a lock on a skipped route sequence. The return transaction indicates whether the lock has been closed.

Transaction information required:

- Lock Name or Serial Number – The name or serial number of the lock to be closed.
- Lock Mode – The mode of the lock to be closed.
- Close Seal – The close seal number for the lock.
- If Forced Closed (Optional) – If the lock is forced closed, the field's value can be set to '1' or 'true'.
- Lock Sequence (Optional) – If the lock has been dispatched on a route, then a valid lock sequence must be specified. In case of an FLM mode lock or a Route mode lock not dispatched on a route, this field can be left out.
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), the entire lock record retrieved after the lock has been closed and information on the close seal. There are two fields which contain information on the close seal - IfCloseSealDuress (indicates duress if set to true), IfCloseSealLowBattery (indicates low battery or clock set required if set to true). If neither of these fields is set to true, the close seal is normal.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock is not open.
- Incorrect close seal.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Attempt to force close a lock not on a skipped route sequence.
- Invalid number of close attempts.
- Lock is open but unassigned.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_CLOSE_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>R</LockMode>
  <!-- Close Seal -->
  <CloseSeal>94</CloseSeal>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CLOSE_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_CLOSE_LOCK), a result record (indicating success), the lock record retrieved after lock close and two fields IfCloseSealDuress, IfCloseSealLowBattery indicating if the close seal is a duress, low battery/clock set seal. In this case, the close seal is a duress seal.

```

</RESPONSE_CLOSE_LOCK>
```

2.2.5 Lock XML File Transactions - Read Lock Data

CenTran Programming Reference Manual

This transaction reads data for an FLM, Route, or Bank mode lock.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to be read.
- Lock Mode - The mode of the lock to be read.
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire lock record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

LockRecord:

LockRecordType	This record type contains lock data from the Cencon system.
<i>LockName</i>	Name of the lock. The combination of (lock name/lock mode) or (lock serial number/lock mode) can be used to uniquely identify a lock.
<i>RecordType</i>	Type of record for the lock. This can be one of the following values: <i>D</i> The lock is deleted (shelved). <i>A</i> The lock is active. <i>P</i> The lock is pending shelf. <i>I</i> The lock has been installed, but never dispatched. Applies to FLM, Route mode locks only. <i>R</i> The lock has been replaced. Note: Lock records for replaced locks are now moved to the lock history table. This is a change from version 3 to version 4 of Cencon.
<i>StartDate</i>	Date the lock was added to the Cencon system. Time is in coordinated universal time.
<i>LastUsedDate</i>	Last date an operation was done with the lock from the Cencon system. Time is in coordinated universal time.
<i>CustomerNumber</i>	Internal number used with security of the lock. Note: No longer used to reference customer information.
<i>LockMode</i>	Mode of the lock. This can be one of the following values: <i>F</i> FLM (First Line Maintenance) <i>R</i> Route <i>B</i> Bank
<i>IfDualMode</i>	Flag indicating the lock requires two users to open the lock.
<i>SerialNumber</i>	Serial number of the lock. The combination of (lock name/lock mode) or (lock serial number/lock mode) can be used to uniquely identify the lock.
<i>AuditCount</i>	Number of dispatches for this mode of the lock. Applies to FLM and Route mode only.
<i>IfLockOpen</i>	Flag indicating the lock is open on a single dispatch.
<i>IfForcedClosed</i>	Flag indicating the lock was last closed in the Cencon system without a valid close seal from the lock.
<i>IfRoute1Issued</i>	Flag indicating the lock is open on a route dispatch for lock sequence 1.
<i>IfRoute2Issued</i>	Flag indicating the lock is open on a route dispatch for lock sequence 2.
<i>IfRoute3Issued</i>	Flag indicating the lock is open on a route dispatch for lock sequence 3.
<i>IfNoAlarm</i>	Flag indicating that an alert is not required for the lock being open too long.
<i>IfSecondLineMaintenanceCall</i>	Flag indicating the lock has been dispatched on a second line maintenance call, and may be open for a long period of time.
<i>IfActivationCall</i>	Flag indicating the lock is dispatched as part of the process of activating the lock.
<i>IfUnassignedOpenCall</i>	Flag indicating the lock was dispatched and then the users were unassigned from the dispatch. Applies to FLM only. Unassign is used as a work around when a customer dispatches an FLM lock to the wrong people.
<i>Seal</i>	Close seal expected from the lock for a single dispatch. Encrypted value in database.
<i>PreviousSeal</i>	Previous close seal expected from the lock for a single dispatch. Encrypted value in database.
<i>RouteSeal1</i>	Close seal expected from the lock for a route lock sequence 1. Encrypted value in database.
<i>RouteSeal2</i>	Close seal expected from the lock for a route lock sequence 2. Encrypted value in database.
<i>RouteSeal3</i>	Close seal expected from the lock for a route lock sequence 3. Encrypted value in database.
<i>PreviousRouteSeal1</i>	Close seal expected from the lock for a previous route lock sequence 1. Encrypted value in database.
<i>PreviousRouteSeal2</i>	Close seal expected from the lock for a previous route lock sequence 2. Encrypted value in database.

<i>PreviousRouteSeal3</i>	Close seal expected from the lock for a previous route lock sequence 3. Encrypted value in database.
<i>OpenTries1</i>	Number of failed tries to close the lock with incorrect close seals for route lock sequence 1.
<i>OpenTries2</i>	Number of failed tries to close the lock with incorrect close seals for route lock sequence 2.
<i>OpenTries3</i>	Number of failed tries to close the lock with incorrect close seals for route lock sequence 3.
<i>TransferReturnCode</i>	Return code for lock being transfered to another Cencon system. Currently not in use.
<i>IssuedComboUser1Seq1</i>	Combination issued for lock for user 1, either for route sequence 1 or issued for single dispatch.
<i>IssuedComboUser1Seq2</i>	Combination issued for lock for user 1 for route sequence 2. Invalid if not dispatched on a route.
<i>IssuedComboUser1Seq3</i>	Combination issued for lock for user 1 for route sequence 3. Invalid if not dispatched on a route.
<i>IssuedComboUser2Seq1</i>	Combination issued for lock for user 2, either for route sequence 1 or issued for single dispatch.
<i>IssuedComboUser2Seq2</i>	Combination issued for lock for user 2 for route sequence 2. Invalid if not dispatched on a route.
<i>IssuedComboUser2Seq3</i>	Combination issued for lock for user 2 for route sequence 3. Invalid if not dispatched on a route.
<i>PreviousComboUser1Seq1</i>	Previous combination issued for lock for user 1, either for route sequence 1 or issued for single dispatch.
<i>PreviousComboUser1Seq2</i>	Previous combination issued for lock for user 1 for route sequence 2. Invalid if not dispatched on a route.
<i>PreviousComboUser1Seq3</i>	Previous combination issued for lock for user 1 for route sequence 3. Invalid if not dispatched on a route.
<i>PreviousComboUser2Seq1</i>	Previous combination issued for lock for user 2, either for route sequence 1 or issued for single dispatch.
<i>PreviousComboUser2Seq2</i>	Previous combination issued for lock for user 2 for route sequence 2. Invalid if not dispatched on a route.
<i>PreviousComboUser2Seq3</i>	Previous combination issued for lock for user 2 for route sequence 3. Invalid if not dispatched on a route.
<i>GroupName</i>	Group name for lock. Used with group access control to determine what users can be dispatched to the lock.
<i>OriginalSerialNumber</i>	Original serial number for lock if this lock was used as a replacement.
<i>Description1</i>	Decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>Description2</i>	Decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>Description3</i>	Decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports..
<i>Description4</i>	Decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>CustomerID</i>	Customer ID associated with the lock. This ID has to be a valid entry in the database customer table.
<i>ATMSerialNumber</i>	ATM serial number text for lock.
<i>UserDefined1</i>	User defined decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>UserDefined2</i>	User defined decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>UserDefined3</i>	User defined decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>UserDefined4</i>	User defined decription text for lock. The label displayed in Cencon for this field may be different, and can be set in Cencon preferences for reports.
<i>Region</i>	Region set for the lock. This must be a valid entry in the database region table. Used to restrict who can access the lock if region control is active.
<i>IfLastRoute1Issued</i>	Flag indicating lock was dispatched for route lock sequence 1.
<i>IfLastRoute2Issued</i>	Flag indicating lock was dispatched for route lock sequence 2.
<i>IfLastRoute3Issued</i>	Flag indicating lock was dispatched for route lock sequence 3.
<i>User1ID1</i>	First User ID that lock was dispatched for route lock sequence 1.
<i>User1ID2</i>	First User ID that lock was dispatched for route lock sequence 2.
<i>User1ID3</i>	First User ID that lock was dispatched for route lock sequence 3.
<i>User2ID1</i>	Second User ID that lock was dispatched for route lock sequence 1.
<i>User2ID2</i>	Second User ID that lock was dispatched for route lock sequence 2.
<i>User2ID3</i>	Second User ID that lock was dispatched for route lock sequence 3.
<i>RouteName1</i>	Route that lock was dispatched for route lock sequence 1.
<i>RouteName2</i>	Route that lock was dispatched for route lock sequence 2.
<i>RouteName3</i>	Route that lock was dispatched for route lock sequence 3.
<i>DispatcherID1</i>	Dispatcher that dispatched lock for route lock sequence 1.
<i>DispatcherID2</i>	Dispatcher that dispatched lock for route lock sequence 2.
<i>DispatcherID3</i>	Dispatcher that dispatched lock for route lock sequence 3.

<i>OpenTime1</i>	Time that lock was dispatched for route lock sequence 1. Time is in coordinated universal time.
<i>OpenTime2</i>	Time that lock was dispatched for route lock sequence 2. Time is in coordinated universal time.
<i>OpenTime3</i>	Time that lock was dispatched for route lock sequence 3. Time is in coordinated universal time.
<i>CloseTime1</i>	Time that lock was closed for route lock sequence 1. Time is in coordinated universal time.
<i>CloseTime2</i>	Time that lock was closed for route lock sequence 2. Time is in coordinated universal time.
<i>CloseTime3</i>	Time that lock was closed for route lock sequence 3. Time is in coordinated universal time.
<i>IfPreviousRoute1Issued</i>	Flag that lock was previously issued to route lock sequence 1.
<i>IfPreviousRoute2Issued</i>	Flag that lock was previously issued to route lock sequence 2.
<i>IfPreviousRoute3Issued</i>	Flag that lock was previously issued to route lock sequence 3.
<i>PreviousUser1ID1</i>	Previous first user id dispatched to route lock sequence 1.
<i>PreviousUser1ID2</i>	Previous first user id dispatched to route lock sequence 2.
<i>PreviousUser1ID3</i>	Previous first user id dispatched to route lock sequence 3.
<i>PreviousUser2ID1</i>	Previous second user id dispatched to route lock sequence 1.
<i>PreviousUser2ID2</i>	Previous second user id dispatched to route lock sequence 2.
<i>PreviousUser2ID3</i>	Previous second user id dispatched to route lock sequence 3.
<i>PreviousRouteName1</i>	Previous route that lock was dispatched on for route lock sequence 1.
<i>PreviousRouteName2</i>	Previous route that lock was dispatched on for route lock sequence 2.
<i>PreviousRouteName3</i>	Previous route that lock was dispatched on for route lock sequence 3.
<i>PreviousOpenTime1</i>	Previous time that lock was dispatched to route lock sequence 1. Time is in coordinated universal time.
<i>PreviousOpenTime2</i>	Previous time that lock was dispatched to route lock sequence 2. Time is in coordinated universal time.
<i>PreviousOpenTime3</i>	Previous time that lock was dispatched to route lock sequence 3. Time is in coordinated universal time.
<i>PreviousCloseTime1</i>	Previous time that lock was closed on route lock sequence 1. Time is in coordinated universal time.
<i>PreviousOpenTime2PreviousCloseTime2</i>	Previous time that lock was closed on route lock sequence 2. Time is in coordinated universal time.
<i>PreviousCloseTime3</i>	Previous time that lock was closed on route lock sequence 3. Time is in coordinated universal time.
<i>ServiceBranch</i>	Text description for service branch lock is assigned to.
<i>Address1</i>	Text description for lock address.
<i>Address2</i>	Text description for lock address.
<i>City</i>	Text description for lock address city.
<i>State</i>	Text description for lock address state.
<i>ZIP</i>	Text description for lock address postal service code.
<i>Country</i>	Text description for lock address country.
<i>KeyCloseSeal</i>	Close seal information used to identify status of lock for reissuing red SA key for Activation.
<i>BankBranchName</i>	Bank branch name lock is assigned to. Applies to bank mode locks only.
<i>BankOpenDelay</i>	Delay before lock is allowed to open. Applies to bank mode locks only.
<i>BankOpenWindow</i>	Period of seconds that lock will be allowed to be opened after open delay. Applies to bank mode locks only.
<i>LockHardwareModel</i>	Field to indicate model of lock. Not in current use. Model of lock is indicated by lock serial number range between the Cencon Gen 1 and Gen 2 lock.
<i>LockActivationStatus</i>	Field indicating if Cencon Gen 2 lock is activated in compatibility mode for Cencon Gen 1.
<i>LockDispatchStatus</i>	Field indicating if Cencon Gen 2 lock is being resynchronized.
<i>TimeZoneID</i>	The time zone a lock was set to for it's daylight savings time transition table. This is a table used to convert GMT to local time for the lock.
<i>LowBatteryDate</i>	The date and time a close seal was received indicating that the clock battery is low on a Cencon Gen 2 lock. This is cleared if a following close seal indicates the clock battery is good.
<i>DuressDate</i>	The date and time a close seal was received indicating that a duress combination was entered into a Cencon Gen 2 lock. This is cleared if a following close seal indicates that no duress combination was entered.
<i>IfLegacyImport</i>	Field indicating that the lock is an import from a legacy system. If a bank mode lock is imported from a legacy system, some security information may be unavailable.
<i>NetworkAddress</i>	The IPV4 or IPV6 network address that the lock was last accessed at. This will not be set if the lock has never been accessed remotely across a network.
<i>NetworkPort</i>	The network port that the lock was last accessed at. This will not be set if the lock has never been accessed remotely across a network.
<i>DisplayIssuedComboUser1Seq1</i>	Combination issued for lock for user 1, either for route sequence 1 or issued for single dispatch. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.

<i>DisplayIssuedComboUser1Seq2</i>	Combination issued for lock for user 1 for route sequence 2. Invalid if not dispatched on a route. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.
<i>DisplayIssuedComboUser1Seq3</i>	Combination issued for lock for user 1 for route sequence 3. Invalid if not dispatched on a route. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.
<i>DisplayIssuedComboUser2Seq1</i>	Combination issued for lock for user 2, either for route sequence 1 or issued for single dispatch. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.
<i>DisplayIssuedComboUser2Seq2</i>	Combination issued for lock for user 2 for route sequence 2. Invalid if not dispatched on a route. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.
<i>DisplayIssuedComboUser2Seq3</i>	Combination issued for lock for user 2 for route sequence 3. Invalid if not dispatched on a route. This field is padded with zeros as needed to make it 6 characters long for ease of use by IVR systems.
<i>CloseSealLength</i>	The close seal length required by the lock. This will be 4 for Gen 2 activated FLM / Route mode locks. This will be 2 for Gen 1 FLM / Route mode locks and Gen 2 FLM / Route mode locks in backwards compatibility mode. This will be 0 for Bank mode locks.
<i>BankModeUserNameArray</i>	This is an array of bank mode lock user names assigned to the lock in Bank mode. If the lock is in FLM or Route mode, this array will not be set.

Example 1 - Success with dispatched FLM mode lock

Input Transaction:

```
<TRANSACTION_READ_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCK), a result record (indicating success) and the retrieved lock record

```
<RESPONSE_READ_LOCK>
  <TRANSACTION_READ_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Lock record found in the database.</Description>
  </ResultRecord>
  <LockRecord>

</RESPONSE_READ_LOCK>

```

Example 3 - Failure

Input Transaction:

```

<TRANSACTION_READ_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID>testp</DispatcherID>
</TRANSACTION_READ_LOCK>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCK), a result record indicating failure with an error code (RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_REGION) and description. In this case, the lock and dispatcher belong to different regions but since the dispatcher belongs to a local region, it can only access locks belonging to that local region.

```

<RESPONSE_READ_LOCK>
  <TRANSACTION_READ_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>testp</DispatcherID>
  </TRANSACTION_READ_LOCK>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_LOCK_REGION</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Dispatcher belongs to a local region. The dispatcher's region does not match the lock's region.</Description>
  </ResultRecord>
</RESPONSE_READ_LOCK>

```

2.2.6 Lock XML File Transactions - Update Lock Data

CenTran Programming Reference Manual

This transaction updates data for an FLM, Route, or Bank mode lock. The lock fields to be updated have to be specified in the input transaction. Those lock fields that are not specified in the input transaction are not changed from their current values. This operation updates a single specific lock, specified by Lock Name and Mode or Lock Serial Number and Mode. There is not an option to apply the updated values to all modes of a lock, as is available under the Cencon application.

Transaction information required:

- Lock Name or Serial Number – The name or serial number of the lock to be updated.
- Lock Mode – The mode of the lock to be updated.
- Group Name (Optional) – The new value for this field
- Customer ID (Optional) – The new value for this field
- ATM Serial Number (Optional) – The new value for this field
- Description 1-4 (Optional) – The new value for these fields
- User Defined 1-4 (Optional) – The new value for these fields
- Region (Optional) – The new value for this field
- Service Branch (Optional) – The new value for this field
- Address 1 (Optional) – The new value for this field
- Address 2 (Optional) – The new value for this field
- City (Optional) – The new value for this field
- State (Optional) – The new value for this field
- ZIP (Optional) – The new value for this field
- Country (Optional) – The new value for this field
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated lock record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Invalid Customer ID (Customer ID not found in database).
- Invalid Region (Region not found in database)
- Invalid Group Name (Group Name cannot have embedded blanks and can only have 2, 4 or 6 characters).
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_LOCK>
<UpdateLockRecord>
  <!-- Lock Name-->
  <LockName>LckNoGID</LockName>
  <!-- Lock Mode-->
  <LockMode>F</LockMode>
  <!-- New Customer ID -->
  <CustomerID>ACustomer</CustomerID>
  <!-- New Address2 -->
  <Address2>HartFord, CT</Address2>
</UpdateLockRecord>
<!-- Dispatcher ID -->
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_LOCK), a result record (indicating success) and the updated lock record with new Customer ID and Address 2 values.

```
<RESPONSE_UPDATE_LOCK>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_UPDATE_LOCK>
<UpdateLockRecord>
  <!-- Lock Name-->
  <LockName>LckNoGID</LockName>
  <!-- Lock Mode-->
  <LockMode>F</LockMode>
  <!-- New Customer ID -->
  <CustomerID>123456</CustomerID>
  <!-- New Address2 -->
  <Address2>HartFord, CT</Address2>
</UpdateLockRecord>
<!-- Dispatcher ID -->
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_LOCK>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_LOCK), a result record indicating failure with an error code (RC_ERR_CUSTOMER_NOT_FOUND) and description. Here, the new Customer ID is invalid because it is not present in the customer table of the database.

```

<RESPONSE_UPDATE_LOCK>

  </TRANSACTION_UPDATE_LOCK>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
    <Description>New Customer Does not exist in the database.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_LOCK>

```

2.2.7 Lock XML File Transactions - Rename Lock

CenTran Programming Reference Manual

This transaction renames an FLM, Route, or Bank mode lock. Only the lock name field is updated. It also updates any active log entry, if open.

Transaction information required:

- Lock Name or Serial Number – The name or lock serial number of the lock to be renamed.
- Lock Mode – The mode of the lock to be renamed.
- New Lock Name – The new name for the lock.
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the renamed lock record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Not authorized due to region (region control active).
- Failed to update log record
- Dispatcher not authorized to do this operation.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_RENAME_LOCK>
  <!-- Lock Name-->
  <LockName>VLK016</LockName>
  <!-- Lock Mode-->
  <LockMode>R</LockMode>
  <!-- New Lock Name -->
  <NewLockName>VLKNewName</NewLockName>
  <!-- Dispatcher ID-->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_RENAME_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_RENAME_LOCK), a result record (indicating success), and the renamed lock record.

```
<RESPONSE_RENAME_LOCK>
  <TRANSACTION_RENAME_LOCK xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <LockName>VLK016</LockName>
    <LockMode>R</LockMode>
    <NewLockName>VLKNewName</NewLockName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_RENAME_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Lock successfully renamed from VLK016 to VLKNewName.
    </Description>
  </ResultRecord>
  <LockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

</RESPONSE_RENAME_LOCK>
```

2.2.8 Lock XML File Transactions - Delete Shelved Lock

CenTran Programming Reference Manual

This transaction deletes a shelved lock from the Cencon database by lock name and mode or by lock serial number and mode. This is supported for shelved FLM, Route, or Bank mode locks. If the lock to be deleted is not in a shelved state, then the lock must first be shelved either using an SA key or by remote communications. This transaction deletes only one mode of a lock from the Cencon database. A lock can have up to three entries in the database, one for FLM, Route and Bank modes.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to be deleted.
- Lock Mode - The mode of the lock to be deleted.
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire deleted lock record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock mode is not shelved.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

Example 1 - Success - Delete By Lock Name

Input Transaction:

```
<TRANSACTION_DELETE_LOCK>
  <LockName>VLK111</LockName>
  <LockMode>F</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_LOCK>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_LOCK), a result record (indicating success) and the lock record that was deleted.

```
<RESPONSE_DELETE_LOCK>

</RESPONSE_DELETE_LOCK>

```

Example 3 - Failure

Input Transaction:

```

<TRANSACTION_DELETE_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_LOCK>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_LOCK), a result record indicating failure with an error code (RC_ERR_DELETE_LOCK_CANNOT_BE_DELETED) and description. In this case, the lock is not shelved, so it can not be deleted.

```

<RESPONSE_DELETE_LOCK>
  <TRANSACTION_DELETE_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_LOCK>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DELETE_LOCK_CANNOT_BE_DELETED</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Failed to delete lock. The lock is either open or has not been shelved.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_LOCK>

```

2.2.9 Lock XML File Transactions - Lock Table Query

CenTran Programming Reference Manual

This transaction queries the lock table for a set of lock records. The query record in the input transaction file contains a set of lock fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Locks' form which searches for locks to be displayed in a lock report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock records in the lock table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Group Name
- Serial Number Minimum and Serial Number Maximum (these values specify a range)
- Lock mode
- If Dual Mode
- Customer Number
- Minimum Audit Count
- Start Date Range (Start Date Start and Start Date End dates)
- Last Used Date range (Last Used Date Start and Last Used Date End dates)
- Lock Status List (Locks in one or more of these modes – Active/Shelved/Install/Pending Shelve/Being Replaced)
- If Lock Open
- If Route Open
- If Unassigned Open Call
- If Forced Closed
- If Search Exact (If the value for this field is false, then like search is used).
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- Description
- User Defined
- Address 1
- Address 2
- City
- State
- ZIP
- Country
- Bank Branch Name
- Lock Type - Gen 1 or Gen 2
- Dispatcher ID - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Notes

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

If the Boolean fields are not present in the query record, they are assumed to have a value of false. All the Boolean value fields start with the characters 'If'. This applies to all the query transactions.

For the Start Date Range and End Date Range search, both the lower and upper bounds for the search have to be specified i.e. both Start Date Start and Start Date End have to be specified. If only Start Date Start is specified in the query record, that search field will not have any effect on the result.

Similarly to the Date Range search, for the Serial Number range search, both the lower (Serial Number Minimum) and upper bounds (Serial Number Maximum) for the search have to be specified.

If string fields such as Address1, Description are left blank, those fields are left out of the search query i.e. CenTran does not search for lock records in which Address or Description field is empty. This applies to all the query transactions.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION LOCK_QUERY>

  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>No lock record found satisfying the search condition.
  </Description>
  </ResultRecord>
</RESPONSE_LOCK_QUERY>

```

2.2.10 Lock XML File Transactions - Lock Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock table matching the given query condition. It operates in the same manner as the Lock Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_LOCK_QUERY_COUNT>
  <LockQueryRecord>
    <!-- long -->
    <SerialNumberMinimum>555000</SerialNumberMinimum>
    <!-- long -->
    <SerialNumberMaximum>500000</SerialNumberMaximum>
    <!-- long -->
    <MinimumCountAudits>0</MinimumCountAudits>
    <!-- date -->
    <StartDateStart>2003-04-30T00:00:00</StartDateStart>
    <!-- date -->
    <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
    <!-- date -->
    <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
    <!-- date -->
    <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
    <!-- list -->
    <ListLockStatus>
      <LockStatus>D</LockStatus>
    </ListLockStatus>
    <!-- bool -->
    <IfSearchExact>1</IfSearchExact>
  </LockQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_QUERY_COUNT>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_QUERY_COUNT>
  <TRANSACTION_LOCK_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <LockQueryRecord>
      <SerialNumberMinimum>555000</SerialNumberMinimum>
      <SerialNumberMaximum>500000</SerialNumberMaximum>
      <MinimumCountAudits>0</MinimumCountAudits>
      <StartDateStart>2003-04-30T00:00:00</StartDateStart>
      <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
      <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
      <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
      <ListLockStatus>
        <LockStatus>D</LockStatus>
      </ListLockStatus>
      <IfSearchExact>1</IfSearchExact>
    </LockQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock records matching the given query: 2.
  </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_LOCK_QUERY_COUNT>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_LOCK_QUERY_COUNT>
  <LockQueryRecord>
    <!-- long -->
    <SerialNumberMinimum>555000</SerialNumberMinimum>
    <!-- long -->
    <SerialNumberMaximum>500000</SerialNumberMaximum>
    <!-- long -->
    <MinimumCountAudits>0</MinimumCountAudits>
    <!-- date -->
    <StartDateStart>2003-04-30T00:00:00</StartDateStart>
    <!-- date -->
    <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
    <!-- date -->
    <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
    <!-- date -->
    <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
    <!-- list -->
    <ListLockStatus>
      <LockStatus>D</LockStatus>
    </ListLockStatus>
```

```

    <!-- bool -->
    <IfSearchExact>1</IfSearchExact>
  </LockQueryRecord>
  <!-- char string -->
  <DispatcherID>rzjill</DispatcherID>
</TRANSACTION_LOCK_QUERY_COUNT>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_QUERY_COUNT), a result record (indicating failure) with an error code (RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION) and description. In this case, the dispatcher rzjill is not authorized to query a lock table.

```

<RESPONSE_LOCK_QUERY_COUNT>
  <TRANSACTION_LOCK_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <LockQueryRecord>
      <SerialNumberMinimum>555000</SerialNumberMinimum>
      <SerialNumberMaximum>500000</SerialNumberMaximum>
      <MinimumCountAudits>0</MinimumCountAudits>
      <StartDateStart>2003-04-30T00:00:00</StartDateStart>
      <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
      <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
      <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
      <ListLockStatus>
        <LockStatus>D</LockStatus>
      </ListLockStatus>
      <IfSearchExact>1</IfSearchExact>
    </LockQueryRecord>
    <DispatcherID>rzjill</DispatcherID>
  </TRANSACTION_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION</ErrorCode>
    <Description>Dispatcher not authorized to perform this operation: Lock Table Query.
  </ResultRecord>
</RESPONSE_LOCK_QUERY_COUNT>

```

2.2.11 Lock XML File Transactions - Read Lock Log Data By Name

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of an open lock.

Transaction information required:

- Lock Name
- Lock Mode

Notes

If the dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region. If the lock is not assigned to the same region as the dispatcher, then the lock log data will be reported as not found.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Example Input Transaction:

```
<TRANSACTION LOCK_LOG_READ_LOCK>
  <LockName>VLK013</LockName>
  <LockMode>R</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_READ_LOCK>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_READ_LOCK), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE LOCK_LOG_READ_LOCK>
  <TRANSACTION LOCK_LOG_READ_LOCK>
    <LockName>VLK013</LockName>
    <LockMode>R</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_READ_LOCK>
  <ResultRecord>

```

2.2.12 Lock XML File Transactions - Read Lock Log Data By Serial Number

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of an open lock.

Transaction information required:

- Lock Serial Number
- Lock Mode

Notes

If the dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region. If the lock is not assigned to the same region as the dispatcher, then the lock log data will be reported as not found.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Example Input Transaction:

```
<TRANSACTION_LOCK_LOG_READ_LOCK>
  <SerialNumber>532019</SerialNumber>
  <LockMode>R</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_READ_LOCK>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_READ_LOCK), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE_LOCK_LOG_READ_LOCK>
  <TRANSACTION_LOCK_LOG_READ_LOCK>

2.2.13 Lock XML File Transactions - Lock Log Table Query

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of open locks. The input transaction file contains a query record which in turn contains a set of lock fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Open Locks' form to search for open locks to be displayed in a lock log report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock records in the lock table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Route Name
- Group Name
- Lock Mode
- If Dual Mode
- Customer Number
- Open Date range (Open Date Start and Open Date End dates)
- Close Date range (Close Date Start and Close Date End dates)
- If Unassigned Open Call
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- If Search Exact (If the value for this field is false, then like search is used)
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Notes

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

For the Open Date Range and Close Date Range search, the lower and upper bounds for the search can be specified independently i.e. Open Date Start may be specified in the query record while Open Date End may be left out and vice versa.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Input Transaction:

```
<TRANSACTION_LOCK_LOG_QUERY>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>Test</LockName>
    <!-- char string -->
    <UserID>rzjill</UserID>
    <!-- char string -->
    <GroupName></GroupName>
    <!-- char string -->
    <RouteName>TestRte5</RouteName>
    <!-- char string -->
    <LockMode>R</LockMode>
    <!-- bool -->
    <IfDualMode>0</IfDualMode>
    <!-- long -->
    <CustomerNumber>0</CustomerNumber>
    <!-- date -->
    <OpenDateStart>2004-04-01T00:00:00</OpenDateStart>
    <!-- date -->
    <OpenDateEnd>2005-04-30T00:00:00</OpenDateEnd>
    <!-- bool -->
    <IfUnassignedOpenCall>0</IfUnassignedOpenCall>
    <!-- char string -->
    <CustomerID></CustomerID>
    <!-- char string -->
    <ATMSerialNumber></ATMSerialNumber>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- char string -->
    <ServiceBranch></ServiceBranch>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
<!-- char string -->
```

```
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_QUERY>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_QUERY), a result record (indicating success) and the lock log records matching the search query.

```

```

2.2.14 Lock XML File Transactions - Lock Log Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log table matching the given query condition. It operates in the same manner as the Lock Log Table Query transaction.

Example

Input Transaction:

```
<TRANSACTION_LOCK_LOG_QUERY_COUNT>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>Test</LockName>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_QUERY_COUNT>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <LockLogQueryRecord>
      <LockName>Test</LockName>
      <IfSearchExact>0</IfSearchExact>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock log records matching the given query: 2.
    </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_LOCK_LOG_QUERY_COUNT>
```

2.2.15 Lock XML File Transactions - Lock Log History Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the Lock Log Table Query, but the query is applied to the Lock Log History table.

Example - Success

Input Transaction:

```
<TRANSACTION_LOCK_LOG_HISTORY_QUERY>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>TestQueryLock1</LockName>
    <!-- char string -->
    <UserID></UserID>
    <!-- char string -->
    <GroupName>aabb</GroupName>
    <!-- char string -->
    <RouteName></RouteName>
    <!-- char string -->
    <LockMode>F</LockMode>
    <!-- bool -->
    <IfDualMode>1</IfDualMode>
    <!-- long -->
    <CustomerNumber>123456</CustomerNumber>
    <!-- date -->
    <OpenDateStart>2004-04-01T00:00:00</OpenDateStart>
    <!-- date -->
    <OpenDateEnd>2005-04-30T00:00:00</OpenDateEnd>
    <!-- date -->
    <CloseDateStart>2004-12-01T00:00:00</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2005-04-30T00:00:00</CloseDateEnd>
    <!-- bool -->
    <IfUnassignedOpenCall>1</IfUnassignedOpenCall>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ATMSerialNumber>123456789</ATMSerialNumber>
    <!-- char string -->
    <Region></Region>
    <!-- char string -->
    <ServiceBranch>the new service branch</ServiceBranch>
    <!-- bool -->
    <IfSearchExact>1</IfSearchExact>
  </LockLogQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_LOCK_LOG_HISTORY_QUERY>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_HISTORY_QUERY), a result record (indicating success) and the lock log history records matching the search query.

```
<RESPONSE_LOCK_LOG_HISTORY_QUERY>
  <TRANSACTION_LOCK_LOG_HISTORY_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <LockLogQueryRecord>
      <LockName>TestQueryLock1</LockName>
      <UserID></UserID>
      <GroupName>aabb</GroupName>

</RESPONSE_LOCK_LOG_HISTORY_QUERY>
```

2.2.16 Lock XML File Transactions - Lock Log History Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log history table matching the given query condition. It operates in the same manner as the Lock Log History Table Query transaction.

Example

Input Transaction:

```
<TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>Test</LockName>
    <!-- date -->
    <CloseDateStart>2005-12-01T00:00:00</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2005-12-30T00:00:00</CloseDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_HISTORY_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT xmlns="http://www.kaba-
mas.com/CenTranTransac.xsd">
    <LockLogQueryRecord>
      <LockName>Test</LockName>
      <CloseDateStart>2005-12-01T00:00:00</CloseDateStart>
      <CloseDateEnd>2005-12-30T00:00:00</CloseDateEnd>
      <IfSearchExact>0</IfSearchExact>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock log history records matching the given query: 0.
    </Description>
  </ResultRecord>
  <QueryCount>0</QueryCount>
</RESPONSE_LOCK_LOG_HISTORY_QUERY_COUNT>
```

2.2.17 Lock XML File Transactions - Lock Log Archive Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the Lock Log Table Query, but the query is applied to the Lock Log Archive table.

Example

Input Transaction:

```
<TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>Test</LockName>
    <!-- date -->
    <CloseDateStart>2004-12-01T00:00:00</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2005-01-30T00:00:00</CloseDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_ARCHIVE_QUERY), a result record (indicating success) and the lock log archive records matching the search query.

```
<RESPONSE LOCK_LOG_ARCHIVE_QUERY>
  <TRANSACTION_LOCK_LOG_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <LockLogQueryRecord>
      <LockName>Test</LockName>
      <CloseDateStart>2004-12-01T00:00:00</CloseDateStart>
      <CloseDateEnd>2005-01-30T00:00:00</CloseDateEnd>
      <IfSearchExact>0</IfSearchExact>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Log archive record/s found satisfying the search condition.
  </Description>
</ResultRecord>
  <LockLogRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>TestQueryLock1</LockName>
    <DispatchID>CentranSS</DispatchID>

2.2.18 Lock XML File Transactions - Lock Log Archive Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log archive table matching the given query condition. It operates in the same manner as the Lock Log Archive Table Query transaction.

Example

Input Transaction:

```
<TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <LockLogQueryRecord>
    <!-- char string -->
    <LockName>Test</LockName>
    <!-- date -->
    <CloseDateStart>2004-12-01T00:00:00</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2005-01-30T00:00:00</CloseDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT xmlns="http://www.kaba-
mas.com/CenTranTransac.xsd">
    <LockLogQueryRecord>
      <LockName>Test</LockName>
      <CloseDateStart>2004-12-01T00:00:00</CloseDateStart>
      <CloseDateEnd>2005-01-30T00:00:00</CloseDateEnd>
      <IfSearchExact>0</IfSearchExact>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC OK</ErrorCode>
    <Description>Number of lock log archive records matching the given query: 2.
    </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_LOCK_LOG_ARCHIVE_QUERY_COUNT>
```

2.2.19 Lock XML File Transactions - Initialize Lock SA Key for Audit Download

CenTran Programming Reference Manual

This transaction is used to initialize a lock SA key for audit download in the specified Cencon keybox.

Transaction information required:

- If Init for Bank Branch - Flag indicating if the lock SA key for audit download is to be initialized for a bank mode only lock. If so, the bank branch must be used to set up the security information on the lock SA key.
- Bank Branch Name - Specifies the bank branch to use if initializing the lock SA key for audit download for a bank mode only lock.
- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the key serial number information.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION_INIT_LOCK_SA_KEY_AUDIT_DOWNLOAD>
    <IfInitForBankBranch>false</IfInitForBankBranch>
    <IPAddress>10.108.6.103:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_INIT_LOCK_SA_KEY_AUDIT_DOWNLOAD>
</CentranXMLScript>
```

Output Transaction:

```
<CentranXMLScript>
  <RESPONSE_INIT_LOCK_SA_KEY_AUDIT_DOWNLOAD>
    <TRANSACTION_INIT_LOCK_SA_KEY_AUDIT_DOWNLOAD>
      <IfInitForBankBranch>false</IfInitForBankBranch>

2.2.20 Lock XML File Transactions - Read Lock SA Key for Audit Download

CenTran Programming Reference Manual

This transaction is used to read the lock SA key for audit download in the specified Cencon keybox. It returns the current matching lock records from the Cencon database, lock activation / shelf records from the lock SA key, and returns the lock audit records from the lock SA key.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.
- An array of lock activate / shelf records read from the lock SA key
- An array of lock audit records read from the lock SA key

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock SA key for audit download.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Lock Activate / Shelf Data:

- Serial Number - This is the serial number for the lock involved in the activate / shelf event.
- Lock Mode - This is an identifier for the lock mode involved in the activate / shelf event. This will be F, R, B.
- LockActivateShelveEvent - This indicates if the event is an activate or a shelf. This will contain either Activate or Shelf.
- OriginatingLockMode - This indicates what originating lock mode was opened in order to activate this lock mode. This will be one of the other lock modes of the lock. If the lock was previously in a shelved (no modes activated) state, this will indicate that the mode was the first mode activated. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- ActivateShelveKey - This is the key model (can) type and key identifier of the lock SA key used to activate the lock mode. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- ActivateShelveDate - This is the date / time of the activate / shelf event in UTC based time.
- User1Key - This is the key model (can) type and key identifier of the first user of the originating lock mode that opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set.
- User1BankID - If the originating lock mode was bank mode, this is the bank mode user ID of the first user of the originating lock mode that opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications or if the originating lock mode was not bank mode, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User1Date - This is the date / time that the first user of the originating lock mode opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User1ID - This is the user ID looked up from the Cencon database for the first user of the originating lock mode opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set.
- User2Key - This is the key model (can) type and key identifier of the second user of the originating lock mode that opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2BankID - If the originating lock mode was bank mode, this is the bank mode user ID of the second user of the originating lock mode that opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications or if the originating lock mode was not bank mode, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2Date - This is the date / time that the second user of the originating lock mode opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2ID - This is the user ID looked up from the Cencon database for the second user of the originating lock mode opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- AbbreviatedCompanyID - This value allows identification of what company activated a lock mode for loss prevention. Each set of company security information for the Cencon USB Key Box includes a unique numeric value to identify the company. This value is also copied to the lock when a lock mode is activated. The company can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- AbbreviatedDeviceID - This value allows identification of what company Cencon USB Key Box activated a lock mode for loss prevention. Each set of company Cencon USB Key Box security information includes a unique numeric value to identify which Cencon USB Key Box was used to initialize the lock SA key for activating the lock. This value is copied to the lock when a lock mode is activated. The company Cencon USB Key Box can be determined by contacting Kaba Mas customer support. If

the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Note								
Key Model Descriptions:								
Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example - Success

Input Transaction:

```

2.2.21 Lock XML File Transactions - Initialize Lock SA Key for Activating Multiple Locks

CenTran Programming Reference Manual

This transaction is used to initialize a lock SA key for activating multiple locks in the specified Cencon keybox.

Transaction information required:

- **Activate Lock Serial Record** - An Activate Lock Serial Record is required for each lock being activated using the lock SA key. The details of this record are described in section [3.10.4 Activate Lock Across Network](#). Each lock mode being activated will require an Activate Lock Serial Record. In the case of Bank mode, this record also has an array of each Bank mode user to add as part of the activation.
- **Lock Mode To Open** - Specifies what lock mode used to open the lock as part of the activation process. If multiple modes of a lock are being activated at the same time, one of those modes must be used to open the lock after activation. In the case of using FLM or Route mode to open the lock, the user or users to open the lock must be dispatched and given a combination. In the case of using Bank mode to open the lock, the user or users must be one added as part of activating Bank mode.

The specified lock mode to open must be one of the modes being activated for each lock serial number being activated.

- **User 1 ID To Dispatch** - Specifies what first user ID to dispatch to open the lock as part of the activation process. This is needed only if FLM or Route mode is specified to open the lock. It is not required if Bank mode was specified to open the lock for the activation process. This user ID will be dispatched for each lock serial number being activated. The user ID must be the same lock mode as the lock mode specified to open.
- **User 2 ID To Dispatch** - Specifies what second user ID to dispatch to open the lock as part of the activation process. If none of the lock modes to open being activated are specified to be dual access, then this second user ID is not needed. This is needed only if FLM or Route mode is specified to open the lock. It is not required if Bank mode was specified to open the lock for the activation process. This user ID will be dispatched for each lock serial number being activated that require dual access for the lock mode to open. The user ID must be the same lock mode as the lock mode specified to open.
- **IP Address and Port** - Specifies the keybox to connect to from CenTran to initialize the key.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

The Cencon Gen 2 lock supports daylight savings time changes through the use of a time offset transition table. This table contains up to 40 entries, which is sufficient for 20 years of operation with two transitions a year. This table is initialized for each lock mode when the lock mode is activated. It is also updated when the time is updated on the lock.

The daylight savings time transition table for the Cencon Gen 2 lock is generated from the selected time zone, using daylight saving time information from the host computer. If the time zone ID is not specified when activating a lock, then the currently set time zone on the host computer is used.

The following is a table of available time zone IDs for the Windows operating system using English. Other language installations may make use of different language time zone IDs.

Windows Time Zone IDs:

UTC Offset	Time Zone ID
-12:00:00	Dateline Standard Time
-11:00:00	UTC-11
-10:00:00	Hawaiian Standard Time
-09:00:00	Alaskan Standard Time

Transaction information returned:**Success:**

- Input Transaction Record
- Result Record (result, error code and description): This contains an overall result for the entire transaction.
- Key Serial Number Information
- Array of Lock Record With Result: A lock record and result record for the activation of that lock record. The results of user(s) being dispatched to lock modes for the activation process are contained in the matching lock records.

Failure:

- Input Transaction Record
- Result Record (result, error code and description): This contains an overall result for the entire transaction. Some possible error codes that indicate errors with individual lock modes are:
 - RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT
 - RC_ERR_ACTIVATE_LOCKS_ALL_PROCESSED_NONE_ACTIVATED
 - RC_ERR_ACTIVATE_LOCKS_SOME_NOT_ACTIVATED
- Key Serial Number Information (if any)
- Array of Lock Record With Result: A lock record and result record for the activation of that lock record. This array may or may not be returned depending on the nature of the error. If the error(s) is with individual lock modes, the error information for each lock mode will be returned with the associated result record.

Note**Key Model Descriptions:**

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

2.2.22 Lock XML File Transactions - Read Lock SA Key for Activating Multiple Locks

CenTran Programming Reference Manual

This transaction is used to read the lock SA key for activating multiple locks in the specified Cencon keybox. It returns the lock activation records from the lock SA key and current matching lock records from the Cencon database.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- Abbreviated Kaba Mas Company ID - This ID is used to identify the company that initialized the activate key.
- Abbreviated Kaba Mas Device ID - This ID is used to identify the Cencon USB Key Box that initialized the activate key.
- An array of daylight savings time transition table entries/li>
- An array of lock activation records read from the lock SA key, along with the matching lock record from the Cencon database.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock SA key for activating locks.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Additional description of returned lock SA key data:

Kaba Mas Abbreviated Company ID:

This value allows identification of what company activated a lock mode for loss prevention. Each set of company security information for the Cencon USB Key Box includes a unique numeric value to identify the company. This value is also copied to the lock when a lock mode is activated. The company can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

Kaba Mas Abbreviated Device ID:

This value allows identification of what company Cencon USB Key Box activated a lock mode for loss prevention. Each set of company Cencon USB Key Box security information includes a unique numeric value to identify which Cencon USB Key Box was used to initialize the lock SA key for activating the lock. This value is copied to the lock when a lock mode is activated. The company Cencon USB Key Box can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

Daylight Savings Time Transition Record Table Data:

- **Transition Time** - This is the date / time of the daylight savings time transition, in UTC based time. The oldest (earliest) transition time that is prior to the current time is used.
- **Time Zone Bias** - This is the offset in minutes for the local time zone. This offset will be applied to UTC based time to determine the current local time.

Lock Activate Record Data:

- **Serial Number** - This is the serial number for the lock involved in the activate / shelve event.
- **Lock Mode** - This is an identifier for the lock mode involved in the activate / shelve event. This will be F, R, B.
- **If Dual Mode** - This flag indicates if the lock mode requires dual access to open. This will be true if two users are required to open the lock. This will be false if only a single user is required to open the lock.
- **If Gen2 Lock** - This flag indicates if the lock mode is for a Cencon Gen 2 activation or an older Cencon Gen 1 lock. This will be true if for a Cencon Gen 2 lock. This will be false if for a Cencon Gen 1 lock.
- **If Processed By Lock** - This flag indicates if the lock activation record was processed by a lock. This will be true if the key has been used to activate a lock. This will be false if the key has not been used to activate a lock.
- **Customer Number** - This is the generated customer number for the activation of the lock mode. This will be a random six digit numeric value.
- **Bank Open Delay** - The bank open delay only applies to bank mode of the lock. This is the number of minutes (from 1 to 99) that a user will have to wait, after entering a combination and inserting the Personal Identifier Key before the lock will open. If no Time Delay to Open is desired, set this field to 0. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Open Window** - The bank open window only applies to bank mode of the lock. The second part of activating with Time Delay is the Window to Open. This specifies the amount of time, in minutes (from 1 to 99), in which a user must re-insert their key to open the lock after the Time Delay has expired. If the lock is not opened before the Window to Open elapses, the lock resets and the combination(s) and key(s) must be repeated, the time delay elapsed and then the lock opened. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Branch ID** - The bank branch ID only applies to bank mode of the lock. If you are activating the bank mode of a lock, then this field will contain the numeric bank branch ID used for the activation of the lock. This numeric bank branch ID is identified in the Cencon database by a unique Bank Branch Name. Any bank mode users that are going to be assigned to the bank mode lock must be associated with the same Bank Branch.
- **Initialization Date** - This is the UTC based date / time that the lock mode was initialized.
- **Lock Record** - This is the matching Cencon database lock record for the lock mode being activated. If the lock mode is being used to open the lock as part of the lock activation process, the lock record will include the dispatched combination

information for the matching lock users to open the lock. For a detailed description of the lock record data, refer to the documentation for [Section 2.2.5 Read Lock Data](#).

- **Lock Key Activate Bank User Record** - This record type will occur multiple times for the activation of a bank mode lock. There will be one bank user record for each user being assigned to the bank mode lock. This record type will contain the following fields:
 - **BankUserID** - This is the numeric bank user ID for the user from the lock SA key. See below for valid ranges for this value for different Cencon generations. Cencon Gen 2 locks supports a greater range of bank user IDs than Cencon Gen 1 locks.
 - **CanType** - This is the can type of the key for the user being added to the bank mode lock. This is a single byte value indicating the hardware model of the key. See below for possible values.
 - **KeyID** - This is the 6 byte key ID for the user being added to the bank mode lock. The combination of the key ID and the can type is a unique value.
 - **IsRequiredChangeCombo** - This flag indicates that the user is required to change their combination at the lock before being permitted to open the lock. This flag is not supported by the Cencon Gen 1 lock. It is supported by the Cencon Gen 2 lock.
 - **IsUserEntryClearedByLock** - This flag indicates that the use entry has been read and cleared by the activation process at a Cencon Gen 1 lock. When a Cencon Gen 1 lock processes a bank mode activation, it clears each user entry to indicate that the user entry has been processed. A Cencon Gen 2 lock does not clear the user entries on a lock SA key for activation.
 - **UserRecord** - This field contains the current matching user record from the Cencon database. For a detailed description of the user record data, refer to the documentation for [Section 2.4.2 Read User Data](#).

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

Example - Success

Input Transaction:

2.2.23 Lock XML File Transactions - Initialize Lock Dispatch State Resynchronization Key

CenTran Programming Reference Manual

This transaction is used to initialize a lock dispatch state resynchronization key in the specified Cencon keybox. This is to resynchronize the state of a Cencon Gen 2 lock in the Cencon database with the actual state of a Cencon Gen 2 lock. The initialized key is taken to the lock to read the current lock dispatch state, and then returned to save the state to the Cencon database.

The lock mode can not be dispatched while this procedure is in process. After initializing a lock dispatch state resynchronization key for a lock mode, the lock mode must either be resynchronized with the returned key or the rechronization must be cancelled.

Transaction information required:

- Either Lock Name or Lock Serial Number - Specifies the lock to have dispatching resynchronized.
- Lock Mode - Specifies the lock mode to have dispatching resynchronized. This must be either FLM or Route mode. Bank mode is not applicable since it has fixed combinations for user keys.
- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), the key serial number information, and the lock record for the lock mode being resynchronized.

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Note

Example - Initialize Lock Dispatch State Resynchronization Key By Lock Serial Number

This example initializes a lock dispatch state resynchronization key in a keybox hosted by a Cencon Keybox Agent on a network, using a direct network connection IP address.

The lock is specified by serial number **1000116** and FLM mode.

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION INIT LOCK RESYNC KEY>
    <SerialNumber>1000116</SerialNumber>
    <LockMode>F</LockMode>
    <IPAddress>10.108.6.94:53003</IPAddress>
    <CommunicationsID/>
```

```
<CommunicationsMethod>Tcp</CommunicationsMethod>
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_INIT_LOCK_RESYNC_KEY>
</CentranXMLScript>
```

Output Transaction:

```
<CentranXMLScript>
  <RESPONSE_INIT_LOCK_RESYNC_KEY>
    <TRANSACTION_INIT_LOCK_RESYNC_KEY>
      <SerialNumber>1000116</SerialNumber>
      <LockMode>F</LockMode>
      <IPAddress>10.108.6.94:53003</IPAddress>
      <CommunicationsID/>
      <CommunicationsMethod>Tcp</CommunicationsMethod>
      <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_INIT_LOCK_RESYNC_KEY>

Example - Initialize Lock Dispatch State Resynchronization Key By Lock Name

This example initializes a lock dispatch state resynchronization key in a keybox hosted by a Cencon Keybox Agent on a network, using a persistent network connection ID for the keybox.

The lock is specified by lock name **Gen2Swingbolt 1000116** and FLM mode.

Input Transaction:

```

<CentranXMLScript>
  <TRANSACTION_INIT_LOCK_RESYNC_KEY>
    <LockName>Gen2Swingbolt 1000116</LockName>
    <LockMode>F</LockMode>
    <IPAddress/>
    <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
    <CommunicationsMethod>TcpClient</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_INIT_LOCK_RESYNC_KEY>
</CentranXMLScript>

```

Output Transaction:

```

<CentranXMLScript>
  <RESPONSE_INIT_LOCK_RESYNC_KEY>
    <TRANSACTION_INIT_LOCK_RESYNC_KEY>
      <LockName>Gen2Swingbolt 1000116</LockName>

2.2.24 Lock XML File Transactions - Read Lock Dispatch State Resynchronization Key

CenTran Programming Reference Manual

This transaction is used to read information for reporting purposes from a lock dispatch state resynchronization key.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- If key was used at lock: Lock Last Open Date
- If key was used at lock: First User To Last Open Lock
- If key was used at lock and lock requires dual access: Second User To Last Open Lock
- Matching Lock Record From Cencon Database

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock resynchronization key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Note

Key Model Descriptions:

Example - Success (Key Not Used At Lock)

The lock resynchronization key was not used at the lock yet.

The remote keybox was connected to using a direct IP address.

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION_READ_LOCK_RESYNC_KEY>
    <IPAddress>10.108.6.94:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_LOCK_RESYNC_KEY>
</CentranXMLScript>
```

Output Transaction:

```

2.2.25 Lock XML File Transactions - Resynchronize Lock Dispatch State With Key

CenTran Programming Reference Manual

This transaction is used to resynchronize the dispatch state stored for a lock in the Cencon database, using security data read from a lock resynchronization key that had been used at the lock.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- Original lock record from before the resynchronization operation.
- Result lock record from after the resynchronization operation.

OriginalLockRecord / ResultLockRecord:

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock resynchronization key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04

2.2.26 Lock XML File Transactions - Cancel Lock Dispatch State Resynchronization

CenTran Programming Reference Manual

This transaction cancels the process of resynchronizing a Cencon database entry for a lock mode with a Cencon Gen 2 Lock dispatch state. This transaction can be used if the resynchronization key to be used at the lock was lost or the lock was found not to be out of sync.

After canceling the resynchronization of the lock, the lock is restored to its normal dispatch state. A new resynchronization key can be made or the lock can be dispatched as normal.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to cancel resynchronization.
- Lock Mode - The mode of the lock to cancel resynchronization.
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the lock record.

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock mode is not in process of being resynchronized.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

Example 1 - Success - Cancel Resynchronization By Lock Name

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION_CANCEL_LOCK_RESYNC>
    <LockName>Gen2Swingbolt 1000116</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CANCEL_LOCK_RESYNC>
</CentranXMLScript>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_CANCEL_LOCK_RESYNC), a result record (indicating success) and the lock record that had resynchronization cancelled.

```
<CentranXMLScript>
  <RESPONSE_CANCEL_LOCK_RESYNC>
    <TRANSACTION_CANCEL_LOCK_RESYNC>
      <LockName>Gen2Swingbolt 1000116</LockName>
      <LockMode>F</LockMode>
      <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_CANCEL_LOCK_RESYNC>
    <ResultRecord>
      <Result>Success</Result>
      <ErrorCode>RC_OK</ErrorCode>
      <IfRetryValid>false</IfRetryValid>
      <Description>Cancel of lock dispatch state resynchronization succeeded.
    </Description>
    </ResultRecord>

```

Example 2 - Success - Cancel Resynchronization By Lock Serial Number

Input Transaction:

```

<CentranXMLScript>
    <TRANSACTION_CANCEL_LOCK_RESYNC>
        <SerialNumber>1000116</SerialNumber>
        <LockMode>F</LockMode>
        <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_CANCEL_LOCK_RESYNC>
</CentranXMLScript>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_CANCEL_LOCK_RESYNC), a result record (indicating success) and the lock record that had resynchronization cancelled.

```

<CentranXMLScript>
    <RESPONSE_CANCEL_LOCK_RESYNC>
        <TRANSACTION_CANCEL_LOCK_RESYNC>

</RESPONSE_CANCEL_LOCK_RESYNC>
</CentranXMLScript>

```

Example 3 - Failure

Input Transaction:

```

<CentranXMLScript>
  <TRANSACTION_CANCEL_LOCK_RESYNC>
    <LockName>VLK678</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CANCEL_LOCK_RESYNC>
</CentranXMLScript>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_CANCEL_LOCK_RESYNC), a result record indicating failure with an error code (RC_ERR_RESYNC_DISPATCHING_CANCEL_NOT_GEN2_LOCK) and description. In this

case, the lock is not a Cencon Gen 2 Lock, so it does not support resynchronize dispatching.

```
<CentranXMLScript>
  <RESPONSE CANCEL LOCK RESYNC>
    <TRANSACTION CANCEL LOCK RESYNC>

2.2.27 Lock XML File Transactions - Initialize Lock Time Set Key

CenTran Programming Reference Manual

This transaction is used to initialize a lock time set key in the specified Cencon keybox. A white hour glass shaped key, iButton model DS1922, is required.

Transaction information required:

- Time Zone ID (Optional)- Unique Identifier for the time zone to use for generating the daylight savings time table to be written to the key.

The lock time set key sets the time at the lock and also updates the daylight savings time transition table on the lock. This daylight savings time transition table is generated based on the specified time zone. If a time zone is not specified, then the CenTran server time zone is used.

The lock time set key contains a table of 40 entries sufficient for 20 years of daylight savings times transitions. Each lock mode of the Cencon lock uses this table to convert from the lock clock in UTC (Coordinated Universal Time) to the current local time.

- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the key serial number information.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Invalid time zone specified.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example - Success without specified time zone, using Cencon Keybox IP address:

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION_INIT_LOCK_TIME_SET_KEY>
    <IPAddress>10.108.6.94:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_INIT_LOCK_TIME_SET_KEY>
</CentranXMLScript>
```

Output Transaction:

```
<CentranXMLScript>
  <RESPONSE_INIT_LOCK_TIME_SET_KEY>
    <TRANSACTION_INIT_LOCK_TIME_SET_KEY>
```

```

        <IPAddress>10.108.6.94:53003</IPAddress>
        <CommunicationsID/>
        <CommunicationsMethod>Tcp</CommunicationsMethod>
        <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_INIT_LOCK_TIME_SET_KEY>
    <ResultRecord>
        <Result>Success</Result>
        <ErrorCode>RC_OK</ErrorCode>
        <IfRetryValid>false</IfRetryValid>
        <Description>Initialize lock time set key succeeded.</Description>
    </ResultRecord>
    <KeyInformation>
        <KeyID>0000000CCCA1</KeyID>
        <CanType>41</CanType>
    </KeyInformation>
</RESPONSE_INIT_LOCK_TIME_SET_KEY>
</CentranXMLScript>

```

Example - Success with specified time zone, using Cencon Keybox persistent connection Identifier:

Input Transaction:

```

<CentranXMLScript>
    <TRANSACTION_INIT_LOCK_TIME_SET_KEY>
        <TimeZoneID>Vladivostok Standard Time</TimeZoneID>
        <IPAddress/>
        <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
        <CommunicationsMethod>TcpClient</CommunicationsMethod>
        <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_INIT_LOCK_TIME_SET_KEY>
</CentranXMLScript>

```

Output Transaction:

```

<CentranXMLScript>
    <RESPONSE_INIT_LOCK_TIME_SET_KEY>
        <TRANSACTION_INIT_LOCK_TIME_SET_KEY>
            <TimeZoneID>Vladivostok Standard Time</TimeZoneID>
            <IPAddress/>
            <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
            <CommunicationsMethod>TcpClient</CommunicationsMethod>
            <DispatcherID>CentranSS</DispatcherID>
        </TRANSACTION_INIT_LOCK_TIME_SET_KEY>
        <ResultRecord>
            <Result>Success</Result>
            <ErrorCode>RC_OK</ErrorCode>
            <IfRetryValid>false</IfRetryValid>
            <Description>Initialize lock time set key succeeded.</Description>
        </ResultRecord>

```

2.2.28 Lock XML File Transactions - Read Time Set Key

CenTran Programming Reference Manual

This transaction is used to read the lock time set key in the specified Cencon keybox. It returns the time set key clock time, server time for comparison, time time zone ID written to the key, and the daylight savings time transition table on the key.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number and model information
- Time set key clock time (UTC)
- Server time for comparison (UTC)
- Measured time drift of the key from server time (Seconds)
- IfKeyClockIsEnabled flag indicating if the key clock is running correctly.
- Key time zone ID. Up to 64 character string in ASCII. The string stored on the key does not support internationalization.
- Array of up to 40 entries of daylight savings time transition records for the lock conversion to local time.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock time set key.
- No key is present in the keybox reader slot.
- The data on the key has been corrupted.

Daylight Savings Time Transition Record:

- TransitionTime - Specifies the time that transition takes affect for calculating local time from the lock clock UTC. The daylight savings time transition is used if the current lock clock UTC time is equal to or greater than the transition time, and the lock clock UTC time is less than the next entry transition time in the table.
- TimeZoneBias - Specifies an integer bias from UTC time in minutes for the local time zone daylight savings time, in minutes. This integer value can be positive or negative.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example - Success. Key is read using persistent network connection ID for keybox.

Note: Key is initialized with Vladivostok Standard Time, which uses a single fixed bias for daylight savings time.

Input Transaction:

```
<CentranXMLScript>
  <TRANSACTION_READ_LOCK_TIME_SET_KEY>
    <IPAddress/>
```

```

    <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
    <CommunicationsMethod>TcpClient</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_LOCK_TIME_SET_KEY>
</CentranXMLScript>

```

Output Transaction:

```

<CentranXMLScript>
  <RESPONSE_READ_LOCK_TIME_SET_KEY>
    <TRANSACTION_READ_LOCK_TIME_SET_KEY>
      <IPAddress/>
      <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
      <CommunicationsMethod>TcpClient</CommunicationsMethod>
      <DispatcherID>CentranSS</DispatcherID>
    </TRANSACTION_READ_LOCK_TIME_SET_KEY>
    <ResultRecord>
      <Result>Success</Result>
      <ErrorCode>RC_OK</ErrorCode>
      <IfRetryValid>false</IfRetryValid>
      <Description>Read of lock time set key succeeded.</Description>
    </ResultRecord>
    <KeyInformation>
      <KeyID>0000000CCCA1</KeyID>
      <CanType>41</CanType>

2.3.1 Route XML File Transactions - Add Route

CenTran Programming Reference Manual

This transaction adds a route to the database. If the route exists, its data can be overwritten if the allow overwrite flag is set in the input transaction file.

Transaction information required:

- Route Name
- Customer ID (A valid Customer ID is either empty or a value corresponding to one of the Customer IDs in the customer table)
- Region (If region control is enabled, region has to be non-empty and should correspond to one of the entries in the region table. If region control is not enabled, region can be empty but any non-empty value should correspond to one of the entries in the region table.)
- If Allow Overwrite (Optional) - Flag to allow overwrite of existing route. All details except route 'Creation Date' are overwritten.
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Route name is empty
- Customer ID not found
- Region not found
- Region control is enabled but region is empty

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ADD_ROUTE>
  <RouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionD</Region>
  </RouteRecord>
  <!-- bool -->
  <IfAllowOverwrite>false</IfAllowOverwrite>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_ROUTE) and a result record (indicating success).

```
<RESPONSE_ADD_ROUTE>
  <TRANSACTION_ADD_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionD</Region>
    </RouteRecord>
    <IfAllowOverwrite>false</IfAllowOverwrite>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route CentranRoute successfully added to the database.
  </Description>
  </ResultRecord>
</RESPONSE_ADD_ROUTE>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_ADD_ROUTE>
  <RouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>NoRegion</Region>
  </RouteRecord>
```

```
<!-- bool -->
<IfAllowOverwrite>true</IfAllowOverwrite>
<!-- char string -->
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_ROUTE), a result record indicating failure with an error code (RC_ERR_REGION_DOESNT_EXIST) and description.

```
<RESPONSE_ADD_ROUTE>
  <TRANSACTION_ADD_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>NoRegion</Region>
    </RouteRecord>
    <IfAllowOverwrite>true</IfAllowOverwrite>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_DOESNT_EXIST</ErrorCode>
    <Description>Region NoRegion does not exist in the region table.</Description>
  </ResultRecord>
</RESPONSE_ADD_ROUTE>
```

2.3.2 Route XML File Transactions - Read a Route

CenTran Programming Reference Manual

This transaction reads a route and all the locks on the route from the database.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, a result record (result, error code and description), the complete route record and all route lock records on the route.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route does not exist.
- Dispatcher not authorized to do this operation.
- Not authorized due to region (region control active).
- Route lock table can't be opened.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_ROUTE>
  <!-- char string -->
  <RouteName>TestRte5 </RouteName>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_ROUTE), a result record (indicating success), the complete route record and all the route lock records found on the route. If no route lock records are found, a comment is placed after the route record indicating that no locks have been found on the route.

```
<RESPONSE_READ_ROUTE>
  <TRANSACTION_READ_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteName>TestRte5</RouteName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route TestRte5 found and read from the route table.
  </Description>
  </ResultRecord>
  <RouteRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RouteName>TestRte5</RouteName>
    <CreationDate>2004-12-25T15:49:18</CreationDate>
    <CustomerID>ACustomer</CustomerID>
    <Region />
  </RouteRecord>
  <!--The following locks have been found on the route:-->
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>VLK015</LockName>
    <User1ID>rzjane</User1ID>
    <User2ID>rzjohn</User2ID>
    <RouteName>TestRte5</RouteName>
    <OpenDate>2004-12-22T15:49:18</OpenDate>
    <CloseDate>2004-12-25T15:49:18</CloseDate>
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RESPONSE_READ_ROUTE>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_READ_ROUTE>
  <!-- char string -->
  <RouteName>CentranRoute</RouteName>
  <!-- char string -->
  <DispatcherID>SuperUserLocalRegion</DispatcherID>
</TRANSACTION_READ_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_ROUTE), a result record indicating failure with an error code (RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION) and description. In this case, the dispatcher belongs to a local (as against global) region different from the route's region.

```
<RESPONSE_READ_ROUTE>
  <TRANSACTION_READ_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>CentranRoute</RouteName>
    <DispatcherID>SuperUserLocalRegion</DispatcherID>
  </TRANSACTION_READ_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION</ErrorCode>
    <Description>Dispatcher belongs to a local region. The dispatcher's
      region does not match the route's region.
    </Description>
  </ResultRecord>
</RESPONSE_READ_ROUTE>
```

2.3.3 Route XML File Transactions - Update a Route

CenTran Programming Reference Manual

This transaction updates data for an existing route in the database. The route fields to be updated have to be specified in the input transaction. Those route fields that are not specified in the input transaction are not changed from their current values.

Transaction information required:

- Route Name
- Customer ID (Optional) – The new value for this field
- Region (Optional) – The new value for this field
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, a result record (result, error code and description) and the updated route record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Invalid Customer ID (Customer ID not found in database).
- Invalid Region (Region not found in database)
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_ROUTE>
  <UpdateRouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>some customerid</CustomerID>
    <!-- char string -->
    <Region>TestRegionD</Region>
  </UpdateRouteRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_ROUTE), a result record (indicating success) and the updated route record with new Customer ID and Region values.

```
<RESPONSE_UPDATE_ROUTE>
  <TRANSACTION_UPDATE_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <UpdateRouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>some customerid</CustomerID>
      <Region>TestRegionD</Region>
    </UpdateRouteRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route CentranRoute data successfully updated.</Description>
  </ResultRecord>
  <RouteRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RouteName>CentranRoute</RouteName>
    <CreationDate>2009-02-16T20:27:53</CreationDate>
    <CustomerID>some customerid</CustomerID>
    <Region>TestRegionD</Region>
  </RouteRecord>
</RESPONSE_UPDATE_ROUTE>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_UPDATE_ROUTE>
  <UpdateRouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionC</Region>
  </UpdateRouteRecord>
  <!-- char string -->
```

```
<DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_UPDATE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_ROUTE), a result record indicating failure with an error code (RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_NEW_REGION) and description. Here, the dispatcher's region is local (in scope as opposed to global) and different from that of the new region for the route. An update route transaction would also fail if the dispatcher's region is local and different from the route's current region.

```
<RESPONSE_UPDATE_ROUTE>
  <TRANSACTION_UPDATE_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UpdateRouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionC</Region>
    </UpdateRouteRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_UPDATE_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_
ROUTE_NEW_REGION</ErrorCode>
    <Description>Dispatcher belongs to a local region.
The dispatcher's region does not match the route's new region.
    </Description>
  </ResultRecord>
</RESPONSE_UPDATE_ROUTE>
```

2.3.4 Route XML File Transactions - Delete a Route

CenTran Programming Reference Manual

This transaction deletes a route from the database. It also deletes the route lock entries for this route from the route lock table.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Failed to delete from route table.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_DELETE_ROUTE>
  <!-- char string -->
  <RouteName>CentranRoute</RouteName>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_ROUTE), a result record (indicating success).

```
<RESPONSE_DELETE_ROUTE>
  <TRANSACTION_DELETE_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteName>CentranRoute</RouteName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route CentranRoute has been deleted successfully.</Description>
  </ResultRecord>
</RESPONSE_DELETE_ROUTE>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_DELETE_ROUTE>
  <!-- char string -->
  <RouteName>123456</RouteName>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_ROUTE), a result record indicating failure with an error code (RC_ERR_ROUTE_NOT_FOUND) and description.

```
<RESPONSE_DELETE_ROUTE>
  <TRANSACTION_DELETE_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteName>123456</RouteName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ROUTE_NOT_FOUND</ErrorCode>
    <Description>Failed to find route 123456 in the route table.
    </Description>
  </ResultRecord>
</RESPONSE_DELETE_ROUTE>
```

2.3.5 Route XML File Transactions - Add Locks to a Route

CenTran Programming Reference Manual

This transaction adds locks to an existing route in the database. The locks to be added are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Array of Lock Records to be added to the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of route locks with a result record for each lock.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks were added successfully). In this case the error code for the transaction would be RC_OK.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of result records (one result record for each lock) with those route lock records that were added successfully to the database.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (some locks were added successfully and the others failed) or if the transaction is a complete failure (none of the locks were added to the route). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in case of complete failure the error code for the transaction would be RC_NOT_OK.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Locks don't exist.
- Locks invalid (not in Active or Install mode).
- Dispatcher and route belong to different regions.
- Not authorized due to authorization role.
- Route and lock belong to different regions

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ADD_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK016</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>2</LockSequence>
  </RouteLockRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_LOCKS_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating success) followed by result records for each lock. The locks that were added to the route lock table have their route lock records retrieved from the table and appended to the end of their result records. The output transaction has one or more RouteLockRecordWithResult parent elements, which is an output unit for each lock record specified in the input file. The unit contains a result record followed by the retrieved route lock record.

```
<RESPONSE_ADD_LOCKS_ROUTE>
  <TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte4</RouteName>
    <RouteLockRecord>
      <LockName>VLK016</LockName>
      <LockSequence>1</LockSequence>
    </RouteLockRecord>
    <RouteLockRecord>
      <LockName>VLK015</LockName>
      <LockSequence>2</LockSequence>
    </RouteLockRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_LOCKS_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>All specified locks have been added to the route.
    </Description>
  </ResultRecord>
  <RouteLockRecordWithResult>
    <ResultRecord>
      <Result>Success</Result>
```

```

        <ErrorCode>RC_OK</ErrorCode>
        <Description>Lock VLK016, sequence 1 added
        successfully to the route lock table.
        </Description>
    </ResultRecord>
    <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
        <LockName>VLK016</LockName>
        <User1ID />
        <User2ID />
        <RouteName>TestRte4</RouteName>
        <OpenDate xsi:nil="true" />
        <CloseDate xsi:nil="true" />
        <LockSequence>1</LockSequence>
        <DispatchOrder>0</DispatchOrder>
        <ResultCode>0</ResultCode>
        <IfCloseSealDuress>0</IfCloseSealDuress>
        <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
    </RouteLockRecord>
</RouteLockRecordWithResult>
<RouteLockRecordWithResult>
    <ResultRecord>
        <Result>Success</Result>
        <ErrorCode>RC_OK</ErrorCode>
        <Description>Lock VLK015, sequence 2 added successfully to the route lock table.
        </Description>
    </ResultRecord>
    <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
        <LockName>VLK015</LockName>
        <User1ID />
        <User2ID />
        <RouteName>TestRte4</RouteName>
        <OpenDate xsi:nil="true" />
        <CloseDate xsi:nil="true" />
        <LockSequence>2</LockSequence>
        <DispatchOrder>0</DispatchOrder>
        <ResultCode>0</ResultCode>
        <IfCloseSealDuress>0</IfCloseSealDuress>
        <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
    </RouteLockRecord>
</RouteLockRecordWithResult>
</RESPONSE_ADD_LOCKS_ROUTE>

```

Example 2 - Partial Failure

Input Transaction:

```

<TRANSACTION_ADD_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- char string -->
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_LOCKS_ROUTE>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating failure with an error code of RC_PARTIAL_OK) for the transaction followed by result records for each lock. Those locks that could be added to the route lock table have their route lock records retrieved from the table and appended to the end of their result records. The output transaction has one or more RouteLockRecordWithResult parent elements, which is an output unit for each lock record specified in the input file. The unit contains a result record followed by the retrieved route lock record (if result is success) and just the result record (if result is failure).

```

<RESPONSE_ADD_LOCKS_ROUTE>
    <TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
        <RouteName>TestRte4</RouteName>

    <CloseDate xsi:nil="true" />
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RouteLockRecordWithResult>
</RESPONSE_ADD_LOCKS_ROUTE>

```

Example 3 - Failure

Input Transaction:

```

<TRANSACTION_ADD_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK009</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLKShelved</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_LOCKS_ROUTE>

```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating failure) followed by result records for each lock that could not be added to the route.

```

<RESPONSE_ADD_LOCKS_ROUTE>
  <TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

```

2.3.6 Route XML File Transactions - Read Locks on a Route

CenTran Programming Reference Manual

This transaction reads data for locks on a route either from the database or from a route file. If successful, the output would include both the route lock record and the corresponding lock record for each lock on the route.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information (route lock, lock records) would be retrieved if the transaction failed due to reasons like lack of authorization or invalid route name. If the pre-requisites like authorization, valid route name are satisfied, the route information retrieved for each lock on the route has a route lock record (if found in database or route file), lock record (if found in database) and result record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (only some of the locks were read successfully) or if the transaction is a complete failure (none of the locks were read successfully). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in case of complete failure the error code for the transaction would be RC_NOT_OK. A lock may not be read successfully if, for example the route lock exists but the matching lock record does not.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route does not exist.
- Invalid route name.
- All locks on route don't exist.
- Dispatcher and route belong to different regions (route belongs to a database).
- Not authorized due to authorization role.
- Validation error.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_LOCKS_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCKS_ROUTE), a result record (indicating success) followed by data for each lock on the route. The output unit for each lock found on the route is LockRecordAndRouteLockRecord which consists of a result record, lock record and route lock record.

        <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
    </RouteLockRecord>
</LockRecordAndRouteLockRecord>
</RESPONSE_READ_LOCKS_ROUTE>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_READ_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte7</RouteName>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_LOCKS_ROUTE>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCKS_ROUTE), a result record (indicating failure) followed by data for each lock on the route. The output unit for each lock found on the route is LockRecordAndRouteLockRecord which consists of a result record, lock record and route lock record. In this case, the route lock record specified in the route file has no matching lock record. So, the result record indicates a failure and only the route lock information retrieved from the route file is displayed.

```

  </LockRecordAndRouteLockRecord>
</RESPONSE_READ_LOCKS_ROUTE>

```

2.3.7 Route XML File Transactions - Delete Locks from a Route

CenTran Programming Reference Manual

This transaction deletes locks from an existing route in the database. The locks to be deleted are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Array of Lock Records to be deleted from the route:
 - Lock name
 - Lock sequence
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of route locks (retrieved prior to deletion) with a result record for each lock.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks were deleted successfully from the route). In this case the error code for the transaction would be RC_OK.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of data for each lock on the route - result record, route lock record (retrieved prior to deletion).

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (some locks were deleted successfully and the others failed) or if the transaction is a complete failure (none of the locks were deleted from the route). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in the case of complete failure, the error code for the transaction would be RC_NOT_OK.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks on route being deleted are open on the route.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.
- Route lock does not exist.

Example

Input Transaction:

```
<TRANSACTION_DELETE_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
  <LockName></LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK011</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK014</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK015</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- char string -->
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_LOCKS_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_LOCKS_ROUTE), a result record (indicating success) followed by result records for each lock. The locks that were found in the route lock table have their route lock records retrieved from the table (prior to deletion) and appended to the end of their result records. In this case, one lock has an invalid name, lock VLK011 was not found, lock VLK014 was open on the route (its route lock record was found and retrieved), and lock VLK015 was deleted successfully (its route lock record was found and retrieved prior to deletion). The error code for the transaction is RC_PARTIAL_OK (because one lock could be deleted successfully from the route) but the overall result is deemed a Failure.

```
<RESPONSE_DELETE_LOCKS_ROUTE>
  <TRANSACTION_DELETE_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte4</RouteName>

</RouteLockRecordWithResult>
</RESPONSE_DELETE_LOCKS_ROUTE>

```

2.3.8 Route XML File Transactions - Dispatch all Locks on a Route

CenTran Programming Reference Manual

This transaction dispatches all locks on an existing route in the database or from a route file.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Flag to indicate if lock errors allowed (conditional dispatch).
- Dispatcher ID (Optional) – If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were dispatched successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were dispatched successfully, and some locks failed).

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name or failure of any other condition that needs to be satisfied before attempting to dispatch a lock on a route. If an attempt was made to dispatch the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure'.

NOTE: The output transaction may have one or more 'LockRecordAndRouteLockRecord' elements. Each element is an output unit for each lock that was either successfully dispatched or failed to be dispatched. The unit contains a result record followed by a lock record (if found in the database) and a route lock record (if found in the database).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks already open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
  <RouteName>TestRte3</RouteName>
  <User1ID>rzjack</User1ID>
  <User2ID>rzjill</User2ID>
  <IfAllowLockErrors>0</IfAllowLockErrors>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>
```

Output Transaction:

Here, the route in the database has no locks assigned to it and so no locks are dispatched.

```
<RESPONSE_DISPATCH_ALL_LOCKS_ROUTE>
  <TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteName>TestRte3</RouteName>
    <User1ID>rzjack</User1ID>
    <User2ID>rzjill</User2ID>
    <IfAllowLockErrors>0</IfAllowLockErrors>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ROUTE_NO_LOCKS_ASSIGNED</ErrorCode>
    <Description>The route has no locks assigned to it.</Description>
  </ResultRecord>
</RESPONSE_DISPATCH_ALL_LOCKS_ROUTE>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
```

```

<RouteName>TestRte4</RouteName>
<User1ID>rzjill</User1ID>
<User2ID>rzjack</User2ID>
<IfAllowLockErrors>0</IfAllowLockErrors>
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>

```

Output Transaction:

NOTE: If no lock errors are allowed, no locks on the route will be dispatched even if one of them causes a group mismatch, region mismatch, does not exist, is already open or is not in active mode. In this case, one lock on the route is already open and so none of the locks are dispatched. Only the details (result record, lock record and route lock record) of the open lock VLK014 are displayed.

```

<RESPONSE_DISPATCH_ALL_LOCKS_ROUTE>
  <TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte4</RouteName>
    <User1ID>rzjill</User1ID>
    <User2ID>rzjack</User2ID>
    <IfAllowLockErrors>0</IfAllowLockErrors>
    <DispatcherID>CentranSS</DispatcherID>

2.3.9 Route XML File Transactions - Dispatch Locks on a Route

CenTran Programming Reference Manual

This transaction dispatches some of the locks on an existing route in the database or from a route file. The locks to be dispatched are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Array of Lock Records to be dispatched on the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) – If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were dispatched successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were dispatched successfully, and some locks failed).

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name or failure of any other condition that needs to be satisfied before attempting to dispatch a lock on a route. If an attempt was made to dispatch the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure'.

NOTE: The output transaction may have one or more 'LockRecordAndRouteLockRecord' elements. Each element is an output unit for each lock that was either successfully dispatched or failed to be dispatched. The unit contains a result record followed by a lock record (if found in the database) and a route lock record (if found in the database).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks already open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_DISPATCH_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
  <RouteName>TestRte4</RouteName>
  <User1ID>fjrb1</User1ID>
  <User2ID>fjrb2</User2ID>
  <IfAllowLockErrors>0</IfAllowLockErrors>
  <RouteLockRecord>
    <LockName>VLK016</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_LOCKS_ROUTE>
```

Output Transaction:

In this case, users fjrb1 and fjrb2 are FLM users and CentranSS is a Special Supervisor. So, none of the locks are dispatched and the error code for the whole transaction is RC_ERR_FLMBOTH_NOT_SAME_MODE_AS_LOCK. Each route lock has its own error code.

```

```

Example 2 - Partial Failure

Input Transaction:

```

<TRANSACTION_DISPATCH_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK013</LockName>
    <LockSequence>1</LockSequence>
    <UserID>rjrb1</UserID>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
    <UserID>rzjill</UserID>
  </RouteLockRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DISPATCH_LOCKS_ROUTE>

```

Output Transaction:

In this example, lock VLK013 does not exist. Therefore an appropriate error code is displayed in the result record. Since no route lock record or lock record for VLK013 exists, only the result record is displayed. Lock VLK014 is dispatched successfully. The error code for the whole transaction is RC_PARTIAL_OK indicating partial success or partial failure, depending on whether you think of the glass as half full or half empty...

```

2.3.10 Route XML File Transactions - Reassign All Locks On a Route

CenTran Programming Reference Manual

This transaction reassigns all locks on an existing route in the database.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were reassigned successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole.

Each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' if the transaction is a partial success (some locks were reassigned successfully and the others failed). In the case of partial success, the error code for the transaction would be RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization or failure of any other condition that needs to be satisfied before attempting to reassign the locks on a route.

If an attempt was made to reassign the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were reassigned on the route). In the case of complete failure, the error code for the transaction will vary depending on the error.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist or otherwise invalid.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte1</RouteName>
  <!-- char string -->
  <User1ID>rzjill</User1ID>
  <!-- char string -->
  <User2ID>rzjack</User2ID>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
```

Output Transaction:

In this example, none of the locks are reassigned because the region control is set and the dispatcher's region (local in scope) does not match the route's region.

```
<RESPONSE_REASSIGN_ALL_LOCKS_ROUTE>
  <TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte1</RouteName>
    <User1ID>rzjill</User1ID>
    <User2ID>rzjack</User2ID>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION</ErrorCode>
    <Description>Dispatcher belongs to a local region. The dispatcher's
      region does not match the route's region.
    </Description>
  </ResultRecord>
</RESPONSE_REASSIGN_ALL_LOCKS_ROUTE>
```

Example 2 - Partial Failure

Input Transaction:

```
<TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- char string -->
  <User1ID>rzjack</User1ID>
  <!-- char string -->
  <User2ID>rzjill</User2ID>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
```

Output Transaction:

In this example, lock VLK014 was reassigned successfully but lock VLK016 wasn't because it was not open. The error code for the whole transaction is 'RC_PARTIAL_OK RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED' which indicates that the transaction partially succeeded and that some locks on the route were not reassigned.

```

2.3.11 Route XML File Transactions - Reassign Locks On a Route

CenTran Programming Reference Manual

This transaction reassigns some locks on an existing route in the database. The locks to be reassigned are specified as route lock records (as defined in the schema) in the input transaction file. This transaction will work even if the route specified in the input transaction does not exist (because it has been deleted after dispatch). The route is determined by what locks are specified in the transaction.

Transaction information required:

- Route User ID 1
- Route User ID 2
- Array of Lock Records to be reassigned on the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were reassigned successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole.

Each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' if the transaction is a partial success (some locks were reassigned successfully and the others failed). In the case of partial success, the error code for the transaction would be RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization or failure of any other condition that needs to be satisfied before attempting to reassign the locks on a route.

If an attempt was made to reassign the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were reassigned on the route). In the case of complete failure, the error code for the transaction will vary depending on the error.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist or otherwise invalid.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_REASSIGN_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <UserID>rzjill</UserID>
  <User2ID>rzjack</User2ID>
  <RouteLockRecord>
    <LockName>VLKNoLock</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_REASSIGN_LOCKS_ROUTE>
```

Output Transaction:

In this example, route TestRte6 does not exist because it has been deleted after lock VLK016 was dispatched on it. The transaction nevertheless succeeds and the details of lock VLK016 are displayed after reassignment.

```
<RESPONSE_REASSIGN_LOCKS_ROUTE>
  <TRANSACTION_REASSIGN_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

2.3.12 Route XML File Transactions - Close Locks on a Route

CenTran Programming Reference Manual

This transaction closes the specified locks on an existing route in the database. This transaction will work even if the route specified in the input transaction does not exist because it has been deleted after dispatch.

Transaction information required:

- Array of Lock Records to be closed on the route:
 - Lock Name
 - Lock Sequence
 - Close Seal
 - Force Close Flag
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all the locks were closed successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were closed successfully, and some locks failed). In this case the error code for the transaction would be RC_RC_ERR_CLOSE_ROUTE_NOT_ALL_CLOSED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name, or failure of any other condition that needs to be satisfied before attempting to close a lock on the route.

If an attempt was made to close the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. There are two exceptions to this rule -

a) If an invalid lock name, invalid lock sequence is specified in the input route lock record: In this case, only the result record is displayed.

b) If one of the locks on the route is to be force closed but is not a skipped route sequence: In this case, that particular lock's details (result record, lock record and route lock record) alone are displayed.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were closed). The error code for the transaction will vary depending on the reason for the failure.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Close seal invalid.
- Number of close attempts exceeded.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_CLOSE_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <CloseRouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>2</LockSequence>
    <CloseSeal>01</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <CloseRouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
    <CloseSeal>0</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <CloseRouteLockRecord>
    <LockName></LockName>
    <LockSequence>1</LockSequence>
    <CloseSeal>0</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_CLOSE_LOCKS_ROUTE>
```

Output Transaction:

In this example, an attempt is made to close a lock with an incorrect close seal, close a lock that is not open, and close a lock with a blank name. The output consists of the details (result record, lock record, route lock record) of each lock.

```
<RESPONSE_CLOSE_LOCKS_ROUTE>
  <TRANSACTION_CLOSE_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">

2.3.13 Route XML File Transactions - Route Table Query

CenTran Programming Reference Manual

This transaction queries the route table for a set of route records. The Input transaction file contains a query record which in turn contains a set of route fields to create a query from. The route query does not have a 'like search' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the route records in the route table are retrieved.

- Route Name
- Creation Date range (Creation Date Start and Creation Date End)
- Customer ID
- Region Name
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: Since the route query does not have a "search like" option, all search field values (except Creation Date range fields) must completely match the values of the fields in the database. If the record for route name TestRoute needs to be searched and retrieved, the value of the route name search field has to be TestRoute and not Test or Route or any other substring of TestRoute.

Note: If the Dispatcher belongs to a local region and region control is enabled, only those routes belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

Note: For the Creation Date Range search, both the lower and upper bounds for the search have to be specified i.e. both Creation Date Start and Creation Date End have to be specified. If only Creation Date Start is specified in the query record, that search field will not have any effect on the result.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the route records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open route table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ROUTE_QUERY>
  <RouteQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionA</Region>
    <!-- date -->
    <CreationDateStart>2004-12-21T00:00:01</CreationDateStart>
    <!-- date -->
    <CreationDateEnd>2005-01-21T00:00:01</CreationDateEnd>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ROUTE_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY>
  <TRANSACTION_ROUTE_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteQueryRecord>
      <RouteName>TestRte1</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionA</Region>
      <CreationDateStart>2004-12-21T00:00:01</CreationDateStart>
      <CreationDateEnd>2005-01-21T00:00:01</CreationDateEnd>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route record/s found satisfying the search condition.
  </Description>
</ResultRecord>
  <RouteRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RouteName>TestRte1</RouteName>
    <CreationDate>2004-12-22T15:49:18</CreationDate>
    <CustomerID>ACustomer</CustomerID>
    <Region>TestRegionA</Region>
  </RouteRecord>
</RESPONSE_ROUTE_QUERY>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_ROUTE_QUERY>
  <RouteQueryRecord>
    <!-- char string -->
    <RouteName>Test</RouteName>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ROUTE_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY>
  <TRANSACTION_ROUTE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteQueryRecord>
      <RouteName>Test</RouteName>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>No route record found satisfying the search condition.
  </Description>
  </ResultRecord>
</RESPONSE_ROUTE_QUERY>
```

2.3.14 Route XML File Transactions - Route Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the route table matching the given query condition. It operates in the same manner as the Route Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ROUTE_QUERY_COUNT>
  <RouteQueryRecord>
    <!-- char string -->
    <Region>TestRegionA</Region>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ROUTE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY_COUNT>
  <TRANSACTION_ROUTE_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteQueryRecord>
      <Region>TestRegionA</Region>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route records matching the given query: 2.</Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ROUTE_QUERY_COUNT>
```

Example 2 - Success

Input Transaction:

```
<TRANSACTION_ROUTE_QUERY_COUNT>
  <RouteQueryRecord>
    <!-- char string -->
    <Region>TestRegionA</Region>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_ROUTE_QUERY_COUNT>
```

Output Transaction:

In this example, SuperUserTestRegionD belongs to a local region TestRegionD and therefore replaces TestRegionA as the search field for the query. Only one route in TestRegionD is found.

```
<RESPONSE_ROUTE_QUERY_COUNT>
  <TRANSACTION_ROUTE_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteQueryRecord>
      <Region>TestRegionA</Region>
    </RouteQueryRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ROUTE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route records matching the given query: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_ROUTE_QUERY_COUNT>
```

2.3.15 Route XML File Transactions - Route Lock Table Query

CenTran Programming Reference Manual

This transaction queries the route lock table for a set of route lock records. The Input transaction file contains a query record which in turn contains a set of route lock fields to create a query from. The route lock query does not have a "search like" option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the route lock records in the route lock table are retrieved.

- Lock Name
- Route Name
- Lock Sequence
- User ID (searches for this User ID in both the FLM1ID and FLM2ID route lock record fields)
- Open Time Date range (Open Date Start and Open Date End)
- Close Time Date range (Close Date Start and Close Date End)
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: Since the route lock query does not have a 'like search' option, all search field values (except the Date range fields) must completely match the values of the fields in the database.

Note: If the Dispatcher belongs to a local region and region control is enabled, the search goes through 2 phases. In the first phase, only those route locks satisfying the search condition are retrieved. In the second phase, the region of each retrieved route lock's route is compared against the dispatcher's region and only those that match are displayed by CenTran.

Note: For the Open Date Range search and Close Date Range search, both the lower and upper bounds of the range have to be specified. If only the lower bound (Date Start) or if only the upper bound (Date End) is specified, that search field will be ignored.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the route lock records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error - failed to open route table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ROUTE_LOCK_QUERY>
  <RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRtel</RouteName>
    <!-- char string -->
    <LockName>VLK020</LockName>
    <!-- char string -->
    <LockSequence>1</LockSequence>
    <!-- char string -->
    <UserID>rzjohn</UserID>
    <!-- date -->
    <OpenDateStart>2004-12-21T00:00:01</OpenDateStart>
    <!-- date -->
    <OpenDateEnd>2004-12-23T00:00:01</OpenDateEnd>
    <!-- date -->
    <CloseDateStart>2004-12-24T00:00:01</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2004-12-26T00:00:01</CloseDateEnd>
  </RouteLockQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ROUTE_LOCK_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_LOCK_QUERY>
  <TRANSACTION_ROUTE_LOCK_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteLockQueryRecord>
      <RouteName>TestRtel</RouteName>
      <LockName>VLK020</LockName>
      <LockSequence>1</LockSequence>
      <UserID>rzjohn</UserID>
      <OpenDateStart>2004-12-21T00:00:01</OpenDateStart>
      <OpenDateEnd>2004-12-23T00:00:01</OpenDateEnd>
      <CloseDateStart>2004-12-24T00:00:01</CloseDateStart>
      <CloseDateEnd>2004-12-26T00:00:01</CloseDateEnd>
    </RouteLockQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_LOCK_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC OK</ErrorCode>
    <Description>Route lock record/s found satisfying the search condition.
    </Description>
  </ResultRecord>
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
```

```

    <LockName>VLK020</LockName>
    <User1ID>rzjane</User1ID>
    <User2ID>rzjohn</User2ID>
    <RouteName>TestRte1</RouteName>
    <OpenDate>2004-12-22T15:49:18</OpenDate>
    <CloseDate>2004-12-25T15:49:18</CloseDate>
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RESPONSE_ROUTE_LOCK_QUERY>

```

Example 2 - Success

Input Transaction:

```

<TRANSACTION_ROUTE_LOCK_QUERY>
  <!-- route lock query record -->
  <RouteLockQueryRecord>
  </RouteLockQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_ROUTE_LOCK_QUERY>

```

Output Transaction:

In this case there are no search fields specified in the route lock query record but the dispatcher belongs to a local region 'TestRegionD'. Therefore, all the locks on routes which belong to TestRegionD are displayed. Here, only those locks on route TestRte4 are retrieved because only TestRte4 belongs to TestRegionD.

```

<RESPONSE_ROUTE_LOCK_QUERY>
  <TRANSACTION_ROUTE_LOCK_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteLockQueryRecord></RouteLockQueryRecord>

2.3.16 Route XML File Transactions - Route Lock Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the route lock table matching the given query condition. It operates in the same manner as the Route Lock Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
  <!-- route lock query record -->
  <RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <LockName>VLK018</LockName>
  </RouteLockQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ROUTE_LOCK_QUERY_COUNT>
  <TRANSACTION_ROUTE_LOCK_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RouteLockQueryRecord></RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <LockName>VLK018</LockName>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route lock records matching the given query: 2.
    </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ROUTE_LOCK_QUERY_COUNT>
```

2.4.1 User XML File Transactions - Change User Name

CenTran Programming Reference Manual

This transaction is used to change a user name, based off of the original name and a given new name.

This transaction renames a user. It is the equivalent of the 'Rename User' operation from a user report in Cencon. It adds a record into the user history table for the old user name. It updates records in the lock log table if the user is a route or flm lock key, and is currently dispatched to a lock. It also updates the route lock table if the user is currently dispatched on a route.

Transaction information required:

- Old User ID
- New User ID
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Old user name invalid.
- New user name invalid or already in use.
- Not authorized due to region (dispatcher region is local and does not match user region).
- Not authorized due to authorization role.
- User is a windows logon user and cannot be renamed because the name is linked to the logon.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_CHANGE_USER_NAME>
  <OldUserID>rzjill</OldUserID>
  <NewUserID>rzjane</NewUserID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CHANGE_USER_NAME>
```

Output Transaction:

The transaction fails because the new User ID already exists in the user database.

```
<RESPONSE_CHANGE_USER_NAME>
  <TRANSACTION_CHANGE_USER_NAME xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <OldUserID>rzjill</OldUserID>
    <NewUserID>rzjane</NewUserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CHANGE_USER_NAME>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_RENAME_USER_ID_
NEW_USER_ID_ALREADY_EXISTS</ErrorCode>
    <Description>Error in renaming user rzjill. Failed to rename user.
The new user ID already exists. A user can not be renamed to an already
existing user ID.
    </Description>
  </ResultRecord>
</RESPONSE_CHANGE_USER_NAME>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_CHANGE_USER_NAME>
  <!-- char string -->
  <OldUserID>MHG\Arch</OldUserID>
  <!-- char string -->
  <NewUserID>Arch</NewUserID>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CHANGE_USER_NAME>
```

Output Transaction:

The transaction fails because the User ID to be renamed is a Windows Logon user.

```
<RESPONSE_CHANGE_USER_NAME>
  <TRANSACTION_CHANGE_USER_NAME xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <OldUserID>MHG\Arch</OldUserID>
    <NewUserID>Arch</NewUserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CHANGE_USER_NAME>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_RENAME_USER_ID_IS
_WINDOWS_LOGON_USER</ErrorCode>
    <Description>Error in renaming user MHG\Arch.
Failed to rename user. The user is a Windows authentication logon user,
```

```
        and the user name must be the same as the Windows logon name to
        allow the user to be identified.
    </Description>
</ResultRecord>
</RESPONSE_CHANGE_USER_NAME>
```

Example 3 - Success

Input Transaction:

```
<TRANSACTION_CHANGE_USER_NAME>
  <OldUserID>rzjill</OldUserID>
  <NewUserID>rzgail</NewUserID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CHANGE_USER_NAME>
```

Output Transaction:

```
<RESPONSE_CHANGE_USER_NAME>
  <TRANSACTION_CHANGE_USER_NAME xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <OldUserID>rzjill</OldUserID>
    <NewUserID>rzgail</NewUserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CHANGE_USER_NAME>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>User rzjill has been successfully changed to rzgail.
  </Description>
  </ResultRecord>
</RESPONSE_CHANGE_USER_NAME>
```

2.4.2 User XML File Transactions - Read User Data

CenTran Programming Reference Manual

This transaction reads data for a user. The password field of a user record, if encrypted, is not displayed and is instead left blank.

Transaction information required:

- User ID (uniquely identifies a user record) or Can Type and Key ID (both these fields together uniquely identify a user record)
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the retrieved user record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

UserRecord:

UserRecordType	This record type contains user data from the Cencon system.												
UserID	Unique user ID identifying the user in the Cencon database.												
SecurityLevel	This is an integer identifying the generic user type. This can be one of the following values: <table border="1"> <tr><td>1</td><td>FLM mode lock key</td></tr> <tr><td>2</td><td>Route mode lock key</td></tr> <tr><td>4</td><td>Bank mode lock key</td></tr> <tr><td>8</td><td>Dispatcher software logon key</td></tr> <tr><td>64</td><td>Supervisor software logon key</td></tr> <tr><td>128</td><td>Special Supervisor software logon key</td></tr> </table>	1	FLM mode lock key	2	Route mode lock key	4	Bank mode lock key	8	Dispatcher software logon key	64	Supervisor software logon key	128	Special Supervisor software logon key
1	FLM mode lock key												
2	Route mode lock key												
4	Bank mode lock key												
8	Dispatcher software logon key												
64	Supervisor software logon key												
128	Special Supervisor software logon key												
KeyID	This is the 6 byte key ID for the key in the key reader. The combination of the key ID and the can type is a unique value.												
CanType	This is the can type of the key. This is a single byte value indicating the hardware model of the key. See below for possible values.												
NumberCombosIssued	This is the current number of combinations that have been issued to the user. This value will vary depending on if the user is currently dispatched to a lock or not. This value will be incremented as the user is dispatched to locks, and decremented as users are closed out from lock dispatches.												
CreationDate	This is data and time that the user was created in the Cencon database.												
DeletionDate	This is data and time that the user was deleted in the Cencon database. This value will be cleared (empty) for currently active users. This value will always be set for user records in the user history table.												
Nickname	This is a nickname that can be assigned to the user. It is used as desired for business operations involving the user.												
NicknameExpirationDate	This is a nickname expiration date that can be assigned to the user. It is used as desired for business operations involving the user.												
GroupName	This is the group name that the user is assigned to. The group name is kept for backwards compatibility only. It is no longer used by the Cencon / CenTran software.												
NumberTimeWindows	This is the number of time access windows to be defined for the user, both in the Cencon database and in the use key. You can define 0 to 3 time windows. If 0, then no time windows are defined to restrict the user access times and the user can open the lock at any time. If one or more time access windows are defined, then the user access to locks is restricted to those time access windows.												
Window1Start / Window2Start / Window3Start	These are the start times during the day that a time access window is starting. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 8 A.M. would be the value 80. These values are cleared (empty) if the time window is not defined.												
Window1Duration / Window2Duration / Window3Duration	These are the duration that a time access window lasts. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 5 hours would be the value 50. These values are cleared (empty) if the time window is not defined.												
IfWindow1Sun / IfWindow1Mon / IfWindow1Tue / IfWindow1Wed / IfWindow1Thu / IfWindow1Fri / IfWindow1Sat	These are the flags for what days of the week that the first time window would be applied. These can be true or false. These values are cleared (empty) if the time window is not defined.												
IfWindow2Sun / IfWindow2Mon / IfWindow2Tue / IfWindow2Wed / IfWindow2Thu / IfWindow2Fri / IfWindow2Sat	These are the flags for what days of the week that the first time window would be applied. These can be true or false. These values are cleared (empty) if the time window is not defined.												
IfWindow3Sun / IfWindow3Mon / IfWindow3Tue / IfWindow3Wed / IfWindow3Thu / IfWindow3Fri / IfWindow3Sat	These are the flags for what days of the week that the first time window would be applied. These can be true or false. These values are cleared (empty) if the time window is not defined.												

<i>Region</i>	This is the Cencon database region that the user is assigned to. If region control is set to be active in your Cencon database, then the user is restricted to being dispatched to locks with the same assigned region as the user. If region control is set to be active in your Cencon database, then you are required to assign a region to the user. If you attempt to assign a region that does not exist, then you will receive an error when trying to add the user.
<i>ServiceBranch</i>	This a descriptive field about the user for use with your business procedures as needed.
<i>FirstName</i>	This a descriptive field about the user for use with your business procedures as needed.
<i>MiddleName</i>	This a descriptive field about the user for use with your business procedures as needed.
<i>LastName</i>	This a descriptive field about the user for use with your business procedures as needed.
<i>LastUsedDate</i>	This is data and time that the user was last used. This is updated with dispatches and closes for FLM and Route mode. It is also updated when a Bank mode user is assigned to a lock. It is updated when a software logon user type logs onto the Cencon software. It is also updated when a software logon user type is used with a transaction with CenTran.
<i>AuthorizationRole</i>	This field contains the named role that the user is assigned to. This will be a predefined role for lock user keys, such as FLM, Route or Bank. This can be a predefined role for software logon keys, such as Dispatcher, Supervisor, or Special Supervisor. For software logon keys, it can also be a customer defined role with custom permissions defined.
<i>BankUserID</i>	This is the Bank Branch User ID that the user is assigned to. This applies to Bank mode users only. The combination of Bank Branch Name and Bank User ID must be unique. If another Bank mode user already has the same values you are trying to use, you will receive an error when adding the user key. The Bank Branch User ID is written to the user key. See the following notes on lock key models and lock model capabilities for details on the permitted ranges for Bank Branch User ID.
<i>TotalNumberCombosIssued</i>	This is a count of the total number of combinations that have been issued to a lock user key. This value is incremented each time that a lock user is dispatched. It is not decremented when the dispatch for the user is closed. It is decremented if the lock dispatch is reassigned to another user.
<i>MaximumNumberAllowedCombos</i>	This value is used to restrict the total number of dispatches that can be issued to a lock user key. If this value is not set, then there is no restriction on the number of times the lock user key can be dispatched. If this value is set, and the total number of combinations issued exceeds this value, then the lock user key is not permitted to be dispatched again.
<i>EnabledStartDate / EnabledEndDate</i>	This is the enabled start date and enabled end date for a user key. These values can be empty if there is no date restriction on the user key. These date / time values are used to set up user keys that are only permitted to be used for a limited amount of time. These values are valid for restricting dispatching of FLM and Route lock user keys. These values are also used for restricting how long a software logon user key is permitted to logon onto the Cencon software or be used in a transaction with CenTran. The <i>EnabledStartDate</i> value restricts when the key is permitted to start being used. The <i>EnabledEndDate</i> value restricts when the key is no longer permitted to be used.
<i>BankBranchName</i>	This is the assigned bank branch name for a bank mode user key. This value will be set for bank mode lock users. It will be cleared for any user type that is not a bank mode user key. Bank mode users can only be assigned to locks with the same bank branch name.
<i>CustomerID</i>	This is a descriptive field about the user for the assigned Customer ID. If this value is being set, it must be a Customer ID that exists in your Cencon database.
<i>UserCombo</i>	This is the initial user combination defined for Bank mode users. This value is used when adding Bank mode users to a Cencon Gen 2 lock. Setting an initial user combination is not supported by Cencon Gen 1 locks.
<i>IfMustChangeCombo</i>	This is a flag indicating that the initial combination defined for Bank mode users must be changed by the user before being permitted to open the lock. This value is used when adding Bank mode users to a Cencon Gen 2 lock. The flag indicating that the user must change their combination is not supported by Cencon Gen 1 locks. This value will be set to true if the user must change their combination prior to opening the lock. This value will be false if the user can use their initial combination to open the lock.
<i>IfLegacyImport</i>	This is a flag indicating that the user is an import from a legacy version of the CenBank software. The CenBank software handled security data differently than the Cencon / CenTran software. This flag indicates that the user key can not be reinitialized without losing the original security data on the key.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C

202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

Example 1 - Success reading user by key serial number (Can Type / Key ID).

Input Transaction:

```
<TRANSACTION_READ_USER>
  <CanType>04</CanType>
  <KeyID>00000023F0D3</KeyID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_USER>
```

Output Transaction:

```
<RESPONSE_READ_USER>
  <TRANSACTION_READ_USER>
    <CanType>04</CanType>
    <KeyID>00000023F0D3</KeyID>

  </ResultRecord>
</RESPONSE_READ_USER>

```

2.4.3 User XML File Transactions - Update User Data

CenTran Programming Reference Manual

This transaction is used to update the database information for a user based on the user name or the user key serial number (Can Type / Key ID).

This transaction updates data for a user. The user fields to be updated have to be specified in the input transaction. Those user fields that are not specified in the input transaction are not changed from their current values. Region for a special supervisor will not be updated because a special supervisor should not be assigned to any region.

Transaction information required:

- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.
- User ID (uniquely identifies a user record) or Can Type and Key ID (both these fields together uniquely identifies a user record)
- Nickname (Optional) - The new value for this field
- Nickname Expiration Date (Optional) - The new value for this field
- Region (Optional) - The new value for this field
- Service Branch (Optional) - The new value for this field
- First Name (Optional) - The new value for this field
- Middle Name (Optional) - The new value for this field
- Last Name (Optional) - The new value for this field
- Customer ID (Optional) - The new value for this field
- Maximum Number Allowed Combos (Optional) - The new value for this field
- Enabled Start Date (Optional) - The new value for this field
- Enabled End Date (Optional) - The new value for this field

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire updated user record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Invalid Customer ID (Customer ID not found in database).
- Invalid Region (Region not found in database)
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_UPDATE_USER>
  <UpdateUserRecord>
    <Region>TestReg</Region>
    <Nickname>jill</Nickname>
    <UserID>rzjill</UserID>
  </UpdateUserRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_USER>
```

Output Transaction:

The transaction fails because the new region does not exist in the region table of the database.

```
<RESPONSE_UPDATE_USER>
  <TRANSACTION_UPDATE_USER>
    <UpdateUserRecord>
      <Region>TestReg</Region>
      <Nickname>jill</Nickname>
      <UserID>rzjill</UserID>
    </UpdateUserRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_USER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CHANGE_REGION_DOESNT_EXIST</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to update user region. The specified region does not exist:
TestReg</Description>
  </ResultRecord>
</RESPONSE_UPDATE_USER>
```

Example 2 - Success updating user by User ID

Input Transaction:

```
<TRANSACTION_UPDATE_USER>
  <UpdateUserRecord>
    <EnabledEndDate>2013-01-01T08:00:00</EnabledEndDate>
    <EnabledStartDate>2009-04-12T08:00:00</EnabledStartDate>
    <CustomerID>ACustomer</CustomerID>
    <LastName>Rockefeller</LastName>
    <MiddleName>K</MiddleName>
    <FirstName>David</FirstName>
```

```

2.4.4 User XML File Transactions - User Change Bank Mode Default Combination

CenTran Programming Reference Manual

This transaction is used to update the database with a new bank mode default combination for a bank mode user based on the user name.

The new bank mode default combination is set only in the user record in the database. This new value for the user's bank mode default combination is used the next time the user is assigned to a Cencon Gen 2 lock. Existing locks that the user is already assigned to will have the old value, unless the user is deleted from and then assigned back to a lock.

Transaction information required:

- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.
- User ID (uniquely identifies a user record)
- User Combination - The new bank mode default combination for the user
- If Must Change Combo - Flag indicating if the user must change from the default combination to a new combination before being permitted to open the lock.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire updated user record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Invalid Combination
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <UserID>Not A Real User Name</UserID>
  <UserCombo>123456</UserCombo>
  <IfMustChangeCombo>>false</IfMustChangeCombo>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
```

Output Transaction:

The transaction fails because the new region does not exist in the region table of the database.

```
<RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
  <TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
    <UserID>Not A Real User Name</UserID>
    <UserCombo>123456</UserCombo>
    <IfMustChangeCombo>>false</IfMustChangeCombo>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_USER_NOT_FOUND</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>User ID not found in database: Not A Real User Name</Description>
  </ResultRecord>
</RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
```

Example 2 - Success updating user by User ID

Input Transaction:

```
<TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <UserID>Bank SHA Key 10004</UserID>
  <UserCombo>123456</UserCombo>
  <IfMustChangeCombo>>false</IfMustChangeCombo>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
```

Output Transaction:

The transaction succeeds and the specified user fields are updated with new values.

```
<RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
  <TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
    <UserID>Bank SHA Key 10004</UserID>
    <UserCombo>123456</UserCombo>
    <IfMustChangeCombo>>false</IfMustChangeCombo>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>The user change bank mode default combination succeeded.</Description>
  </ResultRecord>
```

```

<UserRecord>
  <UserID>Bank SHA Key 10004</UserID>

  <IfLegacyImport>>false</IfLegacyImport>
</UserRecord>
</RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>

```

2.4.5 User XML File Transactions - Add User Key

CenTran Programming Reference Manual

This transaction adds a user key to the Cencon database and initializes a user key using the specified keybox.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- **IP Address** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

User information required:

- **UserID** - This is the unique User ID identifying the user in the Cencon database.
- **AuthorizationRole** - This is the type of user being added. This can be one of the following values:
 - **FLM** - Indicates the user is a lock user key for use with the Cencon lock FLM mode.
 - **Route** - Indicates the user is a lock user key for use with the Cencon lock Route mode.
 - **Bank** - Indicates the user is a lock user key for use with the Cencon lock Bank mode.
- **NumberTimeWindows** - This is the number of time access windows to be defined for the user, both in the Cencon database and in the use key. You can define 0 to 3 time windows. If 0, then no time windows are defined to restrict the user access times and the user can open the lock at any time. If one or more time access windows are defined, then the user access to locks is restricted to those time access windows.
- **Window1Start / Window2Start / Window3Start** - These are the start times during the day that a time access window is starting. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 8 A.M. would be the value 80. These are optional if the time window is not being defined.
- **Window1Duration / Window2Duration / Window3Duration** - These are the duration that a time access window lasts. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 5 hours would be the value 50. These are optional if the time window is not being defined.
- **IfWindow1Sun / IfWindow1Mon / IfWindow1Tue / IfWindow1Wed / IfWindow1Thu / IfWindow1Fri / IfWindow1Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow2Sun / IfWindow2Mon / IfWindow2Tue / IfWindow2Wed / IfWindow2Thu / IfWindow2Fri / IfWindow2Sat** - These are the flags for what days of the week that the second time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow3Sun / IfWindow3Mon / IfWindow3Tue / IfWindow3Wed / IfWindow3Thu / IfWindow3Fri / IfWindow3Sat** - These are the flags for what days of the week that the third time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **Region** - This is the Cencon database region that the user is assigned to. If region control is set to be active in your Cencon database, then the user is restricted to being dispatched to locks with the same assigned region as the user. If region control is set to be active in your Cencon database, then you are required to assign a region to the user. If you attempt to assign a region that does not exist, then you will receive an error when trying to add the user.
- **ServiceBranch** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **CustomerID** - This is a descriptive field about the user for the assigned Customer ID. If this value is being set, it must be a Customer ID that exists in your Cencon database. It is optional.
- **FirstName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **MiddleName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **LastName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **Nickname** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **NicknameExpirationDate** - This is an expiration date for the nickname for use with your business procedures as needed. It is optional.
- **MaximumNumberAllowedCombos** - This is the maximum number of allowed combinations that the user can be dispatched to simultaneously. This applies to FLM and Route lock users. Depending on your settings with the Cencon database, you can configure how many times an FLM or Route lock user can be dispatched. This sets a further restriction on the number of simultaneous dispatches on this specific user. This field does not apply to Bank mode lock users. A value of 0 sets that no restriction is being applied.
- **EnabledStartDate** - This is the starting date that the user can be assigned to locks or dispatched. It is optional.
- **EnabledEndDate** - This is the ending date that the user can be assigned to locks or dispatched. It is optional. This value is written to the user key as well as to the Cencon database.
- **BankBranchName** - This is the bank branch name that the user is assigned to. This applies to Bank mode users only. If you are adding a Bank mode user, then you must specify a Bank Branch Name. The Bank Branch Name must be one that exists in the Cencon database, or you will receive an error when adding the user key.
- **BankUserID** - This is the Bank Branch User ID that the user is assigned to. This applies to Bank mode users only. The combination of Bank Branch Name and Bank User ID must be unique. If another Bank mode user already has the same values you are trying to use, you will receive an error when adding the user key. The Bank Branch User ID is written to the user key. See the following notes on lock key models and lock capabilities for details on the permitted ranges for Bank Branch User ID.
- **UserCombo** - This is the default user combination that a Bank mode lock user key is assigned with. This applies to Bank mode users only. This is written to Bank mode lock user keys that are using DS1963 key model Can Types. It is not written to older DS1427 key model Can Types. This value is valid when used with a DS1963S key on a Cencon Gen 2 lock.
- **IfMustChangeCombo** - This flag specifies if a Bank mode lock user key must change their default combination at the lock before being allowed to open the lock. This is written to Bank mode lock user keys that are using DS1963 key model Can Types. It is not written to older DS1427 key model Can Types. This value is valid when used with a DS1963S key on a Cencon Gen 2 lock.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the created user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User ID already exists in the Cencon database.
- User Key is already in use in the Cencon database.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example 1 - Successful add of FLM user.

Input Transaction:

</RESPONSE_ADD_USER_KEY>

```

Example 2 - Failure adding user key due to key in Cencon Keybox key reader slot already exists in Cencon database.

Input Transaction:

```

<TRANSACTION_ADD_USER_KEY>
  <AddUserKeyRecord>
    <UserID>ANewRouteUser</UserID>
    <AuthorizationRole>Route</AuthorizationRole>
    <NumberTimeWindows>0</NumberTimeWindows>
    <Region>KENTUCKY</Region>
  </AddUserKeyRecord>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_USER_KEY>

```

Output Transaction:

In this example, user rzjoey does not exist in the database.

```

<RESPONSE_ADD_USER_KEY>
  <TRANSACTION_ADD_USER_KEY>
    <AddUserKeyRecord>
      <UserID>ANewRouteUser</UserID>

    <Description>Failed to add user key. The user key in the key reader already exists in
the database.</Description>
  </ResultRecord>
</RESPONSE_ADD_USER_KEY>

```

2.4.6 User XML File Transactions - Edit User Key

CenTran Programming Reference Manual

This transaction updates time access data for a user key in the specified Cencon Keybox reader slot.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- **IP Address** - Specifies the keybox to connect to from CenTran to update the key to.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to update the key to. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

User information required:

- **UserID** - This is the unique User ID identifying the user in the Cencon database.
- **NumberTimeWindows** - This is the number of time access windows to be defined for the user, both in the Cencon database and in the use key. You can define 0 to 3 time windows. If 0, then no time windows are defined to restrict the user access times and the user can open the lock at any time. If one or more time access windows are defined, then the user access to locks is restricted to those time access windows.
- **Window1Start / Window2Start / Window3Start** - These are the start times during the day that a time access window is starting. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 8 A.M. would be the value 80. These are optional if the time window is not being defined.
- **Window1Duration / Window2Duration / Window3Duration** - These are the duration that a time access window lasts. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 5 hours would be the value 50. These are optional if the time window is not being defined.
- **IfWindow1Sun / IfWindow1Mon / IfWindow1Tue / IfWindow1Wed / IfWindow1Thu / IfWindow1Fri / IfWindow1Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow2Sun / IfWindow2Mon / IfWindow2Tue / IfWindow2Wed / IfWindow2Thu / IfWindow2Fri / IfWindow2Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow3Sun / IfWindow3Mon / IfWindow3Tue / IfWindow3Wed / IfWindow3Thu / IfWindow3Fri / IfWindow3Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **EnabledStartDate** - This is the starting date that the user can be assigned to locks or dispatched. It is optional.
- **EnabledEndDate** - This is the ending date that the user can be assigned to locks or dispatched. It is optional. This value is written to the user key as well as to the Cencon database.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User ID does not exist in the Cencon database.
- User Key in the Cencon keybox does not match the specified User ID.
- User Key is not present in the Cencon keybox key reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_USER_KEY>
  <UpdateUserKeyRecord>
    <UserID>F13</UserID>
    <NumberTimeWindows>1</NumberTimeWindows>
    <Window1Start>80</Window1Start>

    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_UPDATE_USER_KEY_WRONG_KEY_IN_READER</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Key in key reader does not match the user: BU01</Description>
  </ResultRecord>
</RESPONSE_UPDATE_USER_KEY>
```

2.4.7 User XML File Transactions - Read Key Information

CenTran Programming Reference Manual

This transaction is used to read the key in the specified Cencon keybox and return key information such as key serial number.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), and an information record about the key.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Key Data:

KeyInformation

This record contains generic data read from the key.

CanType

This is the can type of the key. This is a single byte value indicating the hardware model of the key. See below for possible values.

KeyID

This is the 6 byte key ID for the key in the key reader. The combination of the key ID and the can type is a unique value.

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_KEY>
  <IPAddress>10.108.6.108:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_KEY>
```

Output Transaction:

<RESPONSE_READ_KEY>
  <TRANSACTION_READ_KEY>
    <IPAddress>10.108.6.108:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_KEY>
  <ResultRecord>
```

```

    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>The key read information succeeded.</Description>
  </ResultRecord>
  <KeyInformation>
    <KeyID>0000003D6C33</KeyID>
    <CanType>18</CanType>
  </KeyInformation>
</RESPONSE_READ_KEY>

```

Example 2 - Failure: No key in reader

Input Transaction:

```

<TRANSACTION_READ_KEY>
  <IPAddress>10.108.6.108:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_KEY>

```

Output Transaction:

In this example, there is no key in the keybox reader slot.

```

<RESPONSE_READ_KEY>
  <TRANSACTION_READ_KEY>
    <IPAddress>10.108.6.108:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_PCIO_COMMS_TM_KEY_NOT_PRESENT</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to locate key in key reader: There is no key in the indicated key
reader slot.</Description>
  </ResultRecord>
</RESPONSE_READ_KEY>

```

2.4.8 User XML File Transactions - Read User Key

CenTran Programming Reference Manual

This transaction is used to read the key in the specified Cencon keybox and return the matching user data from the Cencon database.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), the retrieved user record, and an array of user key audits read from the user key.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- No user is assigned to the key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

User Key Audit Data:

- Event Type - This is the text description of the type of event.
- Lock Mode - This is an identifier for the lock mode involved in the event. This will be F, R, B, or empty.
- Serial Number - This is the serial number for the lock involved in the event.
- Lock Name - This is the lock name matching the lock serial number, as looked up from the Cencon database.
- Event Date - This is the date / time of the event in UTC based time.
- Lock Open Time - This is the date / time of the lock open event in UTC based time. This will be empty of not applicable to the event.
- Lock Close Time - This is the date / time of the lock close event in UTC based time. This will be empty of not applicable to the event.
- Lock Close Seal Count - This is the close seal count for the lock mode being closed. This will be empty of not applicable to the event.
- Lock Close Seal - This is the close seal for the lock mode being closed. This will be empty of not applicable to the event.
- Is Duplicate Close Seal - This flag indicates that the close seal is from a #4 operation at the lock to get the last close seal. This is used when the lock close seal was not retrieved by the person to last open the lock.
- Is Key Audit Record CRC Invalid - This flag indicates that the CRC (Cyclic Redundancy Check) value was not correct. This means the audit data could be corrupted or the audit trail on the key has been tampered with.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_USER_KEY>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_USER_KEY>
```

Output Transaction:

```
<RESPONSE_READ_USER_KEY>
  <TRANSACTION_READ_USER_KEY>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>

    <IfRetryValid>>false</IfRetryValid>
    <Description>User key serial number being read was not found in database.</Description>
  </ResultRecord>
</RESPONSE_READ_USER_KEY>

```

Example 3 - Failure: No key in reader

Input Transaction:

```

<TRANSACTION_READ_USER_KEY>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_USER_KEY>

```

Output Transaction:

In this example, there is no key in the keybox reader slot.

```

<RESPONSE_READ_USER_KEY>
  <TRANSACTION_READ_USER_KEY>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_PCIO_COMMS_TM_KEY_NOT_PRESENT</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Failed to locate key in key reader: There is no key in the indicated key
reader slot.</Description>
  </ResultRecord>
</RESPONSE_READ_USER_KEY>

```

2.4.9 User XML File Transactions - Delete User

CenTran Programming Reference Manual

This transaction is used to delete a user from the Cencon database based on the user name.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- User ID - Uniquely identifies a user record to be deleted.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the deleted user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example 1 - Success

Input Transaction:

```
<TRANSACTION_DELETE_USER>
  <UserID>fbob</UserID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_USER>
```

Output Transaction:

```
<RESPONSE_DELETE_USER>
  <TRANSACTION_DELETE_USER>
    <UserID>fbob</UserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_USER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>The user delete succeeded.</Description>
  </ResultRecord>
  <UserRecord>
    <UserID>fbob</UserID>
    <SecurityLevel>2</SecurityLevel>

    <IfMustChangeCombo>true</IfMustChangeCombo>
    <IfLegacyImport>false</IfLegacyImport>
  </UserRecord>
</RESPONSE_DELETE_USER>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_DELETE_USER>
  <UserID>CDD</UserID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_USER>

```

Output Transaction:

In this example, user CDD that is being deleted is a dispatcher.

```

<RESPONSE_DELETE_USER>
  <TRANSACTION_DELETE_USER>
    <UserID>CDD</UserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_USER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>CenTran only supports deleting FLM, Route, and Bank mode lock users.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_USER>

```

2.4.10 User XML File Transactions - User Table Query

CenTran Programming Reference Manual

This transaction queries the user table for a set of user records. The query record in the input transaction file contains a set of user fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Users' form to search for users to be displayed in a user report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the user records in the user table are retrieved.

- User ID
- Nickname
- Group Name
- Key ID
- Array of user authorization roles (FLM, Supervisor etc)
- Combo Issued range (Combo Issued Minimum and Combo Issued Maximum)
- Has Time Window Set flag
- Has Group Name Access Check flag
- Creation Date range (Creation Date Start and Creation Date End)
- Deletion Date range (Deletion Date Start and Deletion Date End - applies to User History and User Archive Table search)
- Last Used Date range (Last Used Date Start and Last Used Date End)
- Enabled Start Date range (Enabled Start Date Start and Enabled Start Date End)
- Enabled End Date range (Enabled End Date Start and Enabled End Date End)
- Region Name
- Customer ID
- Service Branch
- First Name
- Middle Name
- Last Name
- Bank Branch Name
- Lock Serial Number - This specifies to search for users dispatched to a lock serial number.
- List Key Model - This specifies key models (can types) to search for.
- If Search Enabled Users - This specifies to return only enabled users.
- If Search Dispatches Exceeded - This specifies to return only users who have exceeded their permitted number of dispatches.
- If Has Time Window - This specifies to return only users who have a time window restriction defined.
- If Group Name Access Check - This specifies to do a comparison for group name access. Group based access restriction is no longer supported. This field is for backwards compatibility.
- Bank User ID - This specifies to search for a numeric bank user id.
- Bank Branch Name - This specifies to search for users assigned to the specified bank branch.
- If Legacy Import - This specifies to search for users that are a legacy import from an earlier version of the Cenbank software.
- If Search Exact Flag - This specifies that strings used in the search must be an exact match.
- If Post Fix Wild card Only - This specifies that approximate matches of strings are done against the start of the string.
- Dispatcher ID (Optional) - This is not part of the query record. If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: If the Dispatcher belongs to a local region and region control is enabled, only those users belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

Note: For the Creation Date Range, Deletion Date Range, Last Used Date Range and the Combo Issued Range, both the lower and upper bounds for the search have to be specified.

Note: If string fields such as Nickname or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for user records having an empty Nickname or Customer ID field. This applies to all the query transactions.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the user records (with the encrypted password fields left blank) matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open user table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_USER_QUERY>
<UserQueryRecord>
  <!-- char string -->
  <CustomerID>ACustomer</CustomerID>
  <!-- char string -->
  <ServiceBranch>Dieb</ServiceBranch>
  <!-- char string -->
  <FirstName>Query</FirstName>
  <!-- char string -->
  <MiddleName>Q</MiddleName>
  <!-- char string -->
  <LastName>User</LastName>
  <!-- char string -->
  <Nickname>Qu</Nickname>
```

```

```

2.4.11 User XML File Transactions - User Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the user table matching the given query condition. This transaction uses the same format as the User Table Query transaction. Note that you can search for any of the user database columns. The specified search items are "anded" together for the query.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_USER_QUERY_COUNT>
  <UserQueryRecord>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- List of strings -->
    <ListAuthorizationRoles>
      <AuthorizationRole>FLM</AuthorizationRole>
      <AuthorizationRole>Bank</AuthorizationRole>
      <AuthorizationRole>Supervisor</AuthorizationRole>
    </ListAuthorizationRoles>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_QUERY_COUNT>
```

Output Transaction:

In this example, the output indicates that there are 4 FLM/Bank/Supervisor users in region TestRegionD.

```
<RESPONSE_USER_QUERY_COUNT>
  <TRANSACTION_USER_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <UserQueryRecord>
      <Region>TestRegionD</Region>
      <ListAuthorizationRoles>
        <AuthorizationRole>FLM</AuthorizationRole>
        <AuthorizationRole>Bank</AuthorizationRole>
        <AuthorizationRole>Supervisor</AuthorizationRole>
      </ListAuthorizationRoles>
    </UserQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of user records matching the given query: 4.
    </Description>
  </ResultRecord>
  <QueryCount>4</QueryCount>
</RESPONSE_USER_QUERY_COUNT>
```

2.4.12 User XML File Transactions - User History Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query, but is applied against the User History Table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_USER_HISTORY_QUERY>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>Cust</CustomerID>
    <!-- char string -->
    <ServiceBranch>D</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2007-04-02T16:00:00</DeletionDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_HISTORY_QUERY>
```

Output Transaction:

Here, all records in the user history table which have Customer ID like 'Cust' (If Search Exact flag is set to false), Service Branch like 'D' (If Search Exact flag is set to false) and Deletion Date between 2005-03-01 15:00:00 and 2007-04-02 16:00:00 are retrieved. There are two records which match the search condition. The actual Customer ID in these two records is 'ACustomer' and the actual service branch in these two records is 'Dieb'.

2.4.13 User XML File Transactions - User History Table Query Record Count

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query Record Count, but is applied against the User History Table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_USER_HISTORY_QUERY_COUNT>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>D</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2007-04-02T16:00:00</DeletionDateEnd>
    <!-- bool -->
    <IfSearchExact>1</IfSearchExact>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_HISTORY_QUERY_COUNT>
```

Output Transaction:

In this transaction, the Search Exact Flag has been set to true and there are no user history records with Service Branch equal to 'D'. Therefore the query count is 0.

```
<RESPONSE_USER_HISTORY_QUERY_COUNT>
  <TRANSACTION_USER_HISTORY_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>
      <ServiceBranch>D</ServiceBranch>
      <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>

    <Description>Number of user history records matching the given query: 0.
  </ResultRecord>
  <QueryCount>0</QueryCount>
</RESPONSE_USER_HISTORY_QUERY_COUNT>
```

2.4.14 User XML File Transactions - User Archive Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the User Table Query, but is applied against the User Archive Table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION USER_ARCHIVE_QUERY>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>Dieb</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2006-04-02T16:00:00</DeletionDateEnd>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_ARCHIVE_QUERY>
```

Output Transaction:

```
<RESPONSE USER_ARCHIVE_QUERY>
  <TRANSACTION_USER_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>

    <EnabledEndDate xsi:nil="true" />
```

```

    <BankBranchName />
    <CustomerID>ACustomer</CustomerID>
    <UserCombo>0</UserCombo>
    <IfMustChangeCombo>1</IfMustChangeCombo>
  </UserRecord>
</RESPONSE_USER_ARCHIVE_QUERY>

```

Example 2 - Success

Input Transaction:

```

<TRANSACTION_USER_ARCHIVE_QUERY>
  <UserQueryRecord>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ServiceBranch>Dieb</ServiceBranch>
    <!-- date -->
    <DeletionDateStart>2005-03-01T15:00:00</DeletionDateStart>
    <!-- date -->
    <DeletionDateEnd>2006-04-02T16:00:00</DeletionDateEnd>
  </UserQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserLocalRegion</DispatcherID>
</TRANSACTION_USER_ARCHIVE_QUERY>

```

Output Transaction:

The dispatcher's region is local in scope and does not match the region of the user TestQueryUser1 (see example 1). Therefore no records are returned by the search query.

```

<RESPONSE_USER_ARCHIVE_QUERY>
  <TRANSACTION_USER_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UserQueryRecord>
      <CustomerID>ACustomer</CustomerID>
      <ServiceBranch>Dieb</ServiceBranch>

  <QueryCount>1</QueryCount>
</RESPONSE_USER_ARCHIVE_QUERY_COUNT>
```

2.5.1 Customer XML File Transactions - Add Customer

CenTran Programming Reference Manual

This transaction adds a customer record to the Cencon database customer table. The customer ID for the new customer must be a unique value.

Transaction information required:

- Customer ID
- Customer Number (Optional)
- Name (Optional)
- Address 1 (Optional)
- Address 2 (Optional)
- City (Optional)
- State (Optional)
- ZIP Code (Optional)
- Service Branch (Optional)
- Line Branch (Optional)
- Country (Optional)
- Telephone Number (Optional)
- FAX Number (Optional)
- Cell Phone Number (Optional)
- Point Of Contact Information (Optional)
- Email Information (Optional)
- Description (Optional)
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer already exists
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ADD_CUSTOMER>
  <CustomerRecord>
    <CustomerID>2nd Eastern Regional Bank</CustomerID>
    <CustomerNumber>123456</CustomerNumber>
    <CustomerName>AG</CustomerName>
    <CustomerAddress1>805 Press Ave</CustomerAddress1>
    <CustomerAddress2>Suite #19</CustomerAddress2>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerState>KY</CustomerState>
    <CustomerZIP>40508</CustomerZIP>
    <ServiceBranch>Newton Pike</ServiceBranch>
    <LineBranch>Pike Newton</LineBranch>
    <CustomerCountry>US</CustomerCountry>
    <Telephone>(234) 123-4567</Telephone>
    <Fax>(234) 123-1234</Fax>
    <Cell>(123) 123-1234</Cell>
    <PointOfContact>Kaba Mas</PointOfContact>
    <Email>abc@kml.kaba.com</Email>
    <Description>An Eastern Bank</Description>
  </CustomerRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_CUSTOMER>
```

Output Transaction:

The customer is added successfully to the customer table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_CUSTOMER) and a result record (indicating success).

```
<RESPONSE_ADD_CUSTOMER>
  <TRANSACTION_ADD_CUSTOMER>
    <CustomerRecord>
      <CustomerID>2nd Eastern Regional Bank</CustomerID>
      <CustomerNumber>123456</CustomerNumber>
      <CustomerName>AG</CustomerName>
      <CustomerAddress1>805 Press Ave</CustomerAddress1>
      <CustomerAddress2>Suite #19</CustomerAddress2>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerState>KY</CustomerState>
      <CustomerZIP>40508</CustomerZIP>
      <ServiceBranch>Newton Pike</ServiceBranch>
      <LineBranch>Pike Newton</LineBranch>
      <CustomerCountry>US</CustomerCountry>
      <Telephone>(234) 123-4567</Telephone>
      <Fax>(234) 123-1234</Fax>
      <Cell>(123) 123-1234</Cell>
      <PointOfContact>Kaba Mas</PointOfContact>
      <Email>abc@kml.kaba.com</Email>
    </CustomerRecord>
  </TRANSACTION_ADD_CUSTOMER>
```

```

        <Description>An Eastern Bank</Description>
    </CustomerRecord>
    <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_CUSTOMER>
<ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Customer 2nd Eastern Regional Bank successfully added to the database.
</Description>
</ResultRecord>
</RESPONSE_ADD_CUSTOMER>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_ADD_CUSTOMER>
  <CustomerRecord>
    <CustomerID>123456789</CustomerID>
    <CustomerNumber>777</CustomerNumber>
    <CustomerName>AG</CustomerName>
    <CustomerAddress1>888 Press Avenue</CustomerAddress1>
    <CustomerAddress2>Apt 121</CustomerAddress2>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerState>KY</CustomerState>
    <CustomerZIP>40508</CustomerZIP>
    <ServiceBranch>Newton Pike</ServiceBranch>
    <LineBranch>Pike Newton</LineBranch>
    <CustomerCountry>US</CustomerCountry>
    <Telephone>(234) 123-4567</Telephone>
    <Fax>(234) 123-1234</Fax>
    <Cell>(123) 123-1234</Cell>
    <PointOfContact>Kaba Mas</PointOfContact>
    <Email>abc@kml.kaba.com</Email>
    <Description>Attempt at adding existing customer record</Description>
  </CustomerRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_CUSTOMER>

```

Output Transaction:

In this example, Customer ID 123456789 already exists in the customer table and therefore the transaction fails.

```

<RESPONSE_ADD_CUSTOMER>
  <TRANSACTION_ADD_CUSTOMER>
    <CustomerRecord>
      <CustomerID>123456789</CustomerID>
      <CustomerNumber>777</CustomerNumber>
      <CustomerName>AG</CustomerName>
      <CustomerAddress1>888 Press Avenue</CustomerAddress1>
      <CustomerAddress2>Apt 121</CustomerAddress2>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerState>KY</CustomerState>
      <CustomerZIP>40508</CustomerZIP>
      <ServiceBranch>Newton Pike</ServiceBranch>
      <LineBranch>Pike Newton</LineBranch>
      <CustomerCountry>US</CustomerCountry>
      <Telephone>(234) 123-4567</Telephone>
      <Fax>(234) 123-1234</Fax>
      <Cell>(123) 123-1234</Cell>
      <PointOfContact>Kaba Mas</PointOfContact>
      <Email>abc@kml.kaba.com</Email>
      <Description>Attempt at adding existing customer record</Description>
    </CustomerRecord>

  </TRANSACTION_ADD_CUSTOMER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_ADD_CUSTOMER_ALREADY_EXISTS</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Customer 123456789 already exists.</Description>
  </ResultRecord>
</RESPONSE_ADD_CUSTOMER>

```

2.5.2 Customer XML File Transactions - Read Customer

CenTran Programming Reference Manual

This transaction reads a customer from the database.

Transaction information required:

- Customer ID
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the customer record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_CUSTOMER>
  <CustomerID>2nd Eastern Regional Bank</CustomerID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_CUSTOMER>
```

Output Transaction:

```
<RESPONSE_READ_CUSTOMER>
  <TRANSACTION_READ_CUSTOMER>
    <CustomerID>2nd Eastern Regional Bank</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_CUSTOMER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>

2.5.3 Customer XML File Transactions - Update Customer

CenTran Programming Reference Manual

This transaction updates data for an existing customer in the database. The customer fields to be updated have to be specified in the input transaction. Those customer fields that are not specified in the input transaction will not be changed from their current values.

Transaction information required:

- Customer ID
- Customer Number (Optional) – The new value for this field
- Name (Optional) – The new value for this field
- Address 1 (Optional) – The new value for this field
- Address 2 (Optional) – The new value for this field
- City (Optional) – The new value for this field
- State (Optional) – The new value for this field
- ZIP Code (Optional) – The new value for this field
- Service Branch (Optional) – The new value for this field
- Line Branch (Optional) – The new value for this field
- Country (Optional) – The new value for this field
- Telephone Number (Optional) – The new value for this field
- FAX Number (Optional) – The new value for this field
- Cell Phone Number (Optional) – The new value for this field
- Point Of Contact Information (Optional) – The new value for this field
- Email Information (Optional) – The new value for this field
- Description (Optional) – The new value for this field
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated customer record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_CUSTOMER>
  <UpdateCustomerRecord>
    <Description>Updating Customer Record</Description>
    <CustomerAddress2>Suite #13</CustomerAddress2>
    <CustomerAddress1>809 Transcript Ave</CustomerAddress1>
    <CustomerNumber>123321</CustomerNumber>
    <CustomerID>2nd Eastern Regional Bank</CustomerID>
  </UpdateCustomerRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_CUSTOMER>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_CUSTOMER), a result record (indicating success) and the updated customer record with new Customer Number, Address1, Address 2 and Description values.

```
<RESPONSE_UPDATE_CUSTOMER>
  <TRANSACTION_UPDATE_CUSTOMER>
    <UpdateCustomerRecord>
      <Description>Updating Customer Record</Description>
      <CustomerAddress2>Suite #13</CustomerAddress2>
      <CustomerAddress1>809 Transcript Ave</CustomerAddress1>
      <CustomerNumber>123321</CustomerNumber>
      <CustomerID>2nd Eastern Regional Bank</CustomerID>
    </UpdateCustomerRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_CUSTOMER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Customer 2nd Eastern Regional Bank successfully updated in the database.
  </ResultRecord>
  <CustomerRecord>
    <CustomerID>2nd Eastern Regional Bank</CustomerID>

</CustomerRecord>
</RESPONSE_UPDATE_CUSTOMER>

```

Example 2 - Failure

Input Transaction:

```

<TRANSACTION_UPDATE_CUSTOMER>
  <UpdateCustomerRecord>
    <Description>Failed attempt to update customer record.</Description>
    <CustomerAddress2>Suite #13</CustomerAddress2>
    <CustomerAddress1>809 Transcript Ave</CustomerAddress1>
    <CustomerNumber>123456</CustomerNumber>
  </UpdateCustomerRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_CUSTOMER>

```

Output Transaction:

The transaction fails because the Customer ID is invalid (empty).

```

<RESPONSE_UPDATE_CUSTOMER>
  <TRANSACTION_UPDATE_CUSTOMER>
    <UpdateCustomerRecord>
      <Description>Failed attempt to update customer record.</Description>
      <CustomerAddress2>Suite #13</CustomerAddress2>

    <IfRetryValid>false</IfRetryValid>
    <Description>Invalid customer ID. Customer ID is blank.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_CUSTOMER>

```

2.5.4 Customer XML File Transactions - Delete Customer

CenTran Programming Reference Manual

This transaction deletes a customer from the database.

Transaction information required:

- Customer ID
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Customer ID
- Customer does not exist
- Customer is being referenced by one or more locks, users, route, or bank branch.
- Not authorized due to authorization role

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_DELETE_CUSTOMER>
  <CustomerID>NoCustomer</CustomerID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_CUSTOMER>
```

Output Transaction:

```
<RESPONSE_DELETE_CUSTOMER>
  <TRANSACTION_DELETE_CUSTOMER>
    <CustomerID>NoCustomer</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_CUSTOMER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find customer NoCustomer in the customer table.</Description>
  </ResultRecord>
</RESPONSE_DELETE_CUSTOMER>
```

Example 2 - Success

Input Transaction:

```
<TRANSACTION_DELETE_CUSTOMER>
  <CustomerID>Yet Another Customer 3</CustomerID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_CUSTOMER>
```

Output Transaction:

```
<RESPONSE_DELETE_CUSTOMER>
  <TRANSACTION_DELETE_CUSTOMER>
    <CustomerID>Yet Another Customer 3</CustomerID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_CUSTOMER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Customer Yet Another Customer 3 has been deleted successfully.
  </ResultRecord>
</RESPONSE_DELETE_CUSTOMER>
```

2.5.5 Customer XML File Transactions - Query Customer Table

CenTran Programming Reference Manual

This transaction queries a customer table for a set of customer records. The query record in the input transaction file contains a set of customer fields to create a query from. The query record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Customers' form to search for customers to be displayed in a customer report.

Transaction information required:

- Customer ID (Optional)
- Search Exact flag for Customer ID (Optional)
- Customer Number (Optional)
- Name (Optional)
- Address 1 (Optional)
- Address 2 (Optional)
- City (Optional)
- State (Optional)
- ZIP Code (Optional)
- Service Branch (Optional)
- Line Branch (Optional)
- Country (Optional)
- Telephone Number (Optional)
- FAX Number (Optional)
- Cell Phone Number (Optional)
- Point Of Contact Information (Optional)
- Email Information (Optional)
- Description (Optional)
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: If string fields such as Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for customer records in which Name or Customer ID field is empty).

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the customer records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error – failed to open customer table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_CUSTOMER_QUERY>
  <CustomerQueryRecord>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerName>AG</CustomerName>
  </CustomerQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CUSTOMER_QUERY>
```

Output Transaction:

By default, all fields except Customer Number are searched for values 'like' those given in the query record. For example, searching for Customer Name like 'Cust' will return all records whose Customer Name has 'Cust' as a substring. The search 'exact' option is available for the CustomerID field alone.

```
<RESPONSE_CUSTOMER_QUERY>
  <TRANSACTION_CUSTOMER_QUERY>
    <CustomerQueryRecord>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerName>AG</CustomerName>

```

2.5.6 Customer XML File Transactions - Query Customer Table Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the customer table matching the given query condition. This transaction uses the same format as the Customer Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_CUSTOMER_QUERY_COUNT>
  <CustomerQueryRecord>
    <CustomerCity>Lexington</CustomerCity>
    <CustomerName>AG</CustomerName>
  </CustomerQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CUSTOMER_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_CUSTOMER_QUERY_COUNT>
  <TRANSACTION_CUSTOMER_QUERY_COUNT>
    <CustomerQueryRecord>
      <CustomerCity>Lexington</CustomerCity>
      <CustomerName>AG</CustomerName>
    </CustomerQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CUSTOMER_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of customer records matching the given query: 3.</Description>
  </ResultRecord>
  <QueryCount>5</QueryCount>
</RESPONSE_CUSTOMER_QUERY_COUNT>
```

2.6.1 Bank Branch XML File Transactions - Add Bank Branch

CenTran Programming Reference Manual

This transaction adds a bank branch to the database.

Transaction information required:

- Bank Branch Name (64 character string)
- Bank Branch ID (0-9999 for Gen 1, 0-2 Billion for Gen 2)
- Customer ID (64 character string that must match an existing customer.)
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid bank branch name
- Bank branch name already exists
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ADD_BANK_BRANCH>
  <BankBranchRecord>
    <BankBranchName>North East Bank Branch</BankBranchName>
    <BankBranchID>1235</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_BANK_BRANCH>
```

Output Transaction:

The bank branch is added successfully to the bank branch table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_BANK_BRANCH) and a result record (indicating success).

```
<RESPONSE_ADD_BANK_BRANCH>
  <TRANSACTION_ADD_BANK_BRANCH>
    <BankBranchRecord>
      <BankBranchName>North East Bank Branch</BankBranchName>
      <BankBranchID>1235</BankBranchID>
      <CustomerID>North Bank</CustomerID>
    </BankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>BankBranch North East Bank Branch successfully added to the database.
  </Description>
  </ResultRecord>
</RESPONSE_ADD_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_ADD_BANK_BRANCH>
  <BankBranchRecord>
    <BankBranchName>North Bank Branch</BankBranchName>
    <BankBranchID>1234</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_BANK_BRANCH>
```

Output Transaction:

In this example, Bank branch name **North Bank Branch** already exists in the bank branch table.

```
<RESPONSE_ADD_BANK_BRANCH>
  <TRANSACTION_ADD_BANK_BRANCH>
    <BankBranchRecord>
      <BankBranchName>North Bank Branch</BankBranchName>
      <BankBranchID>1234</BankBranchID>
      <CustomerID>North Bank</CustomerID>
    </BankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ADD_BANK_BRANCH_ALREADY_EXISTS</ErrorCode>
```

```
<IfRetryValid>false</IfRetryValid>  
  <Description>Bank Branch North Bank Branch already exists.</Description>  
</ResultRecord>  
</RESPONSE_ADD_BANK_BRANCH>
```

2.6.2 Bank Branch XML File Transactions - Read a Bank Branch

CenTran Programming Reference Manual

This transaction reads a bank branch from the database.

Transaction information required:

- Bank Branch Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the bank branch record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Bank branch does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_BANK_BRANCH>
  <BankBranchName>North Bank Branch</BankBranchName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_READ_BANK_BRANCH>
  <TRANSACTION_READ_BANK_BRANCH>
    <BankBranchName>North Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Success</Description>
  </ResultRecord>
  <BankBranchRecord>
    <BankBranchName>North Bank Branch</BankBranchName>
    <BankBranchID>1234</BankBranchID>
    <CustomerID>North Bank</CustomerID>
  </BankBranchRecord>
</RESPONSE_READ_BANK_BRANCH>
```

Example 2 - Failure because bank branch does not exist

Input Transaction:

```
<TRANSACTION_READ_BANK_BRANCH>
  <BankBranchName>NoBankBranch</BankBranchName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_BANK_BRANCH>
```

Output Transaction:

Here, the bank branch **NoBankBranch** does not exist.

```
<RESPONSE_READ_BANK_BRANCH>
  <TRANSACTION_READ_BANK_BRANCH>
    <BankBranchName>NoBankBranch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_BANK_BRANCH_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find the bank branch in the database bank branch table. The
bank branch name is not in the database bank branch table.</Description>
  </ResultRecord>
</RESPONSE_READ_BANK_BRANCH>
```

Example 3 - Failure because dispatcher is not authorized for access

Input Transaction:

```
<TRANSACTION_READ_BANK_BRANCH>
  <BankBranchName>North Bank Branch</BankBranchName>
  <DispatcherID>Auth test user</DispatcherID>
</TRANSACTION_READ_BANK_BRANCH>
```

Output Transaction:

Here, the dispatcher is not authorized to log onto Cencon or CenTran.

```
<RESPONSE_READ_BANK_BRANCH>
  <TRANSACTION_READ_BANK_BRANCH>
    <BankBranchName>North Bank Branch</BankBranchName>
    <DispatcherID>Auth test user</DispatcherID>
  </TRANSACTION_READ_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_LOG_ON</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>The current dispatcher is not authorized to log onto Cencon or CenTran.
Log On authorization is required to have access to Cencon operations or CenTran transactions.
</Description>
  </ResultRecord>
</RESPONSE_READ_BANK_BRANCH>
```

2.6.3 Bank Branch XML File Transactions - Update a Bank Branch

CenTran Programming Reference Manual

This transaction updates data for an existing bank branch in the database. The bank branch fields to be updated have to be specified in the input transaction. Those bank branch fields that are not specified in the input transaction will not be changed from their current values. The numeric bank branch ID can not be changed because it is written as part of the security data to bank mode locks.

Transaction information required:

- Bank Branch Name
- Customer ID (Optional) – The new value for this field
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated bank branch record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Bank Branch Name
- Bank Branch does not exist
- Customer does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_BANK_BRANCH>
  <UpdateBankBranchRecord>
    <CustomerID>Eastern Bank</CustomerID>
    <BankBranchName>North East Bank Branch</BankBranchName>
  </UpdateBankBranchRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_BANK_BRANCH>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_BANK_BRANCH), a result record (indicating success) and the updated bank branch record with the updated Customer ID value.

```
<RESPONSE_UPDATE_BANK_BRANCH>
  <TRANSACTION_UPDATE_BANK_BRANCH>
    <UpdateBankBranchRecord>
      <CustomerID>Eastern Bank</CustomerID>
      <BankBranchName>North East Bank Branch</BankBranchName>
    </UpdateBankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Bank Branch North East Bank Branch has been updated successfully.
  </Description>
</ResultRecord>
  <BankBranchRecord>
    <BankBranchName>North East Bank Branch</BankBranchName>
    <BankBranchID>1235</BankBranchID>
    <CustomerID>Eastern Bank</CustomerID>
  </BankBranchRecord>
</RESPONSE_UPDATE_BANK_BRANCH>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_UPDATE_BANK_BRANCH>
  <UpdateBankBranchRecord>
    <CustomerID>SomeInvalidCustomer</CustomerID>
    <BankBranchName>North East Bank Branch</BankBranchName>
  </UpdateBankBranchRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_BANK_BRANCH>
```

Output Transaction:

The transaction fails because the Customer ID is invalid (empty).

```
<RESPONSE_UPDATE_BANK_BRANCH>
  <TRANSACTION_UPDATE_BANK_BRANCH>
    <UpdateBankBranchRecord>
      <CustomerID>SomeInvalidCustomer</CustomerID>
      <BankBranchName>North East Bank Branch</BankBranchName>
    </UpdateBankBranchRecord>
    <DispatcherID>CentranSS</DispatcherID>
```

```
</TRANSACTION_UPDATE_BANK_BRANCH>
<ResultRecord>
  <Result>Failure</Result>
  <ErrorCode>RC_ERR_CUSTOMER_NOT_FOUND</ErrorCode>
  <IfRetryValid>false</IfRetryValid>
  <Description>New customer SomeInvalidCustomer does not exist in the customer table.
</Description>
</ResultRecord>
</RESPONSE_UPDATE_BANK_BRANCH>
```

2.6.4 Bank Branch XML File Transactions - Delete Bank Branch

CenTran Programming Reference Manual

This transaction deletes a bank branch from the database. The bank branch must not have any bank mode locks or users assigned to it.

Transaction information required:

- Bank Branch Name
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid bank branch name
- Bank branch does not exist
- Bank branch is still in use
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_DELETE_BANK_BRANCH>
  <BankBranchName>North East Bank Branch</BankBranchName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_DELETE_BANK_BRANCH>
  <TRANSACTION_DELETE_BANK_BRANCH>
    <BankBranchName>North East Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_BANK_BRANCH>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Bank Branch North East Bank Branch has been deleted successfully.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_BANK_BRANCH>
```

Example 2 - Failure because bank branch does not exist.

Input Transaction:

```
<TRANSACTION_DELETE_BANK_BRANCH>
  <BankBranchName>NoBankBranch</BankBranchName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_DELETE_BANK_BRANCH>
  <TRANSACTION_DELETE_BANK_BRANCH>
    <BankBranchName>NoBankBranch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_BANK_BRANCH_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find bank branch NoBankBranch in the bank branch table.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_BANK_BRANCH>
```

Example 3 - Failure because bank branch is still in use.

Input Transaction:

```
<TRANSACTION_DELETE_BANK_BRANCH>
  <BankBranchName>North Bank Branch</BankBranchName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_BANK_BRANCH>
```

Output Transaction:

```
<RESPONSE_DELETE_BANK_BRANCH>
  <TRANSACTION_DELETE_BANK_BRANCH>
    <BankBranchName>North Bank Branch</BankBranchName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_BANK_BRANCH>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_DELETE_BANK_BRANCH_STILL_IN_USE</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to delete the bank branch from the database bank branch table. The
bank branch is still in use by one or more locks or users.</Description>
  </ResultRecord>
</RESPONSE_DELETE_BANK_BRANCH>
```

2.6.5 Bank Branch XML File Transactions - Query Bank Branch Table

CenTran Programming Reference Manual

This transaction queries a bank branch table for a set of bank branch records. The query record in the input transaction file contains a set of bank branch fields to create a query from. The query record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Bank Branches' form to search for bank branches to be displayed in a bank branch report.

Transaction information required:

- Bank Branch Name
- Bank Branch ID minimum value (0-9999 for Gen 1, 0-2 Billion for Gen 2)
- Bank Branch ID maximum value (0-9999 for Gen 1, 0-2 Billion for Gen 2)
- Customer ID
- Search Exact flag
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: If string fields such as Bank Branch Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for bank branch records in which Bank Branch Name or Customer ID field is empty).

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the bank branch records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error – failed to open bank branch table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_BANK_BRANCH_QUERY>
  <BankBranchQueryRecord>
    <BankBranchIDMaximum>2900</BankBranchIDMaximum>
    <BankBranchIDMinimum>2800</BankBranchIDMinimum>
  </BankBranchQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_BANK_BRANCH_QUERY>
```

Output Transaction:

```
<RESPONSE_BANK_BRANCH_QUERY>
  <TRANSACTION_BANK_BRANCH_QUERY>
    <BankBranchQueryRecord>
      <BankBranchIDMaximum>2900</BankBranchIDMaximum>
      <BankBranchIDMinimum>2800</BankBranchIDMinimum>
    </BankBranchQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_BANK_BRANCH_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of bank branch records matching the given query: 4.</Description>
  </ResultRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2804)</BankBranchName>
    <BankBranchID>2804</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2813)</BankBranchName>
    <BankBranchID>2813</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2857)</BankBranchName>
    <BankBranchID>2857</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
  <BankBranchRecord>
    <BankBranchName>Bank of the West (2858)</BankBranchName>
    <BankBranchID>2858</BankBranchID>
    <CustomerID>Bank of the West</CustomerID>
  </BankBranchRecord>
</RESPONSE_BANK_BRANCH_QUERY>
```

2.6.6 Bank Branch XML File Transactions - Query Bank Branch Table Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the bank branch table matching the given query condition. This transaction uses the same format as the Bank Branch Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_BANK_BRANCH_QUERY_COUNT>
  <BankBranchQueryRecord>
    <BankBranchIDMaximum>2900</BankBranchIDMaximum>
    <BankBranchIDMinimum>2600</BankBranchIDMinimum>
  </BankBranchQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_BANK_BRANCH_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_BANK_BRANCH_QUERY_COUNT>
  <TRANSACTION_BANK_BRANCH_QUERY_COUNT>
    <BankBranchQueryRecord>
      <BankBranchIDMaximum>2900</BankBranchIDMaximum>
      <BankBranchIDMinimum>2600</BankBranchIDMinimum>
    </BankBranchQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_BANK_BRANCH_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of bank branch records matching the given query: 7.</Description>
  </ResultRecord>
  <QueryCount>7</QueryCount>
</RESPONSE_BANK_BRANCH_QUERY_COUNT>
```

2.7.1 Activity Log XML File Transactions - Activity Log Table Query

CenTran Programming Reference Manual

This transaction queries an activity log table for a set of activity log records. The query record passed contains a set of activity log fields to create a query from. The record also contains a flag indicating if 'like' search or 'exact' search is to be used. The query transaction attempts to work in a similar fashion as Cencon's 'Find Activity Data' form to search for audit or activity log records to be displayed in the activity log report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the activity log records are retrieved from the activity log table.

- Event Time Date range (Event Time Start and Event Time End)
- Lock Name
- Route Name
- User ID
- Lock Mode
- Customer ID
- Serial Number Range (Serial Number Start and Serial Number End)
- ATM Serial Number
- Region
- Search Exact Flag
- Dispatcher ID (Optional) – This is not part of the query record. If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: If string fields such as Lock Name or Customer ID are left blank, those fields are left out of the search query (CenTran does not search for activity log records having an empty Lock Name or Customer ID field).

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the activity log records (with selected fields) matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open activity log table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ACTIVITY_QUERY>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK014</LockName>
    <!-- char string -->
    <LockMode>F</LockMode>
    <!-- char string -->
    <RouteName></RouteName>
    <!-- char string -->
    <UserID>fjrb1</UserID>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ATMSerialNumber>asdfasd</ATMSerialNumber>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>true</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ACTIVITY_QUERY>
```

Output Transaction:

The transaction succeeds and returns a record which happens to be a reassign call event on lock VLK014.

```
<RESPONSE_ACTIVITY_QUERY>
  <TRANSACTION_ACTIVITY_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">

```

2.7.2 Activity Log XML File Transactions - Activity Log Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the activity log table query matching the given query condition. This transaction uses the same format as the Activity Log Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ACTIVITY_QUERY_COUNT>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK014</LockName>
    <!-- char string -->
    <LockMode>F</LockMode>
    <!-- char string -->
    <RouteName></RouteName>
    <!-- char string -->
    <UserID>fjrb1</UserID>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <ATMSerialNumber>asdfasd</ATMSerialNumber>
    <!-- char string -->
    <Region>TestRegionD</Region>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>true</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ACTIVITY_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ACTIVITY_QUERY_COUNT>
  <TRANSACTION_ACTIVITY_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK014</LockName>
      <LockMode>F</LockMode>
      <RouteName></RouteName>
      <UserID>fjrb1</UserID>
      <CustomerID>ACustomer</CustomerID>
      <ATMSerialNumber>asdfasd</ATMSerialNumber>
      <Region>TestRegionD</Region>
      <SerialNumberMinimum>530000</SerialNumberMinimum>
      <SerialNumberMaximum>540000</SerialNumberMaximum>
      <EventDateStart>2004-12-24T00:00:00</EventDateStart>
      <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
      <IfSearchExact>true</IfSearchExact>
    </AuditQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ACTIVITY_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC OK</ErrorCode>
    <Description>Number of audit record/s found satisfying the search condition: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_ACTIVITY_QUERY_COUNT>
```

2.7.3 Activity Log XML File Transactions - Activity Log Archive Table Query

CenTran Programming Reference Manual

This transaction operates in the same manner as the Activity Log Table Query, but is applied against the Activity Archive Log Table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ACTIVITY_ARCHIVE_QUERY>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK</LockName>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_ACTIVITY_ARCHIVE_QUERY>
```

Output Transaction:

The transaction returns all activity archive records matching the given search fields and also an additional search field – that of region being 'TestRegionD' because the dispatcher belongs to that local region.

```
<RESPONSE_ACTIVITY_ARCHIVE_QUERY>
  <TRANSACTION_ACTIVITY_ARCHIVE_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK</LockName>

2.7.4 Activity Log XML File Transactions - Activity Log Archive Table Query Record Count

CenTran Programming Reference Manual

This transaction operates in the same manner as the Activity Log Table Query Record Count, but is applied against the Activity Archive Log Table.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <AuditQueryRecord>
    <!-- char string -->
    <LockName>VLK</LockName>
    <!-- long -->
    <SerialNumberMinimum>530000</SerialNumberMinimum>
    <SerialNumberMaximum>540000</SerialNumberMaximum>
    <!-- date -->
    <EventDateStart>2004-12-24T00:00:00</EventDateStart>
    <EventDateEnd>2004-12-24T23:55:00</EventDateEnd>
    <!-- bool -->
    <IfSearchExact>0</IfSearchExact>
  </AuditQueryRecord>
  <!-- char string -->
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT xmlns="http://www.kaba-
mas.com/CenTranTransac.xsd">
    <AuditQueryRecord>
      <LockName>VLK</LockName>
      <SerialNumberMinimum>530000</SerialNumberMinimum>
      <SerialNumberMaximum>540000</SerialNumberMaximum>

    </AuditQueryRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ACTIVITY_ARCHIVE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of audit archive record/s found satisfying the search condition: 2.
    </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ACTIVITY_ARCHIVE_QUERY_COUNT>
```

2.8.1 Authorization XML File Transactions - Authorization Roles Table Query

CenTran Programming Reference Manual

This transaction queries the Authorization Roles table for a set of Authorization Role records. The input transaction file contains a query record which in turn contains a set of authorization role fields to create a query from. The authorization role query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization role records in the role table are retrieved.

- Authorization Role
- Description
- Enabled flag
- If Exclude Special Roles - This excludes roles such as FLM, Route, and Bank that are placeholders for lock key roles.
- Dispatcher ID - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the role records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization role table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_ROLE_QUERY>
  <AuthorizationRoleQueryRecord>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
  </AuthorizationRoleQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_ROLE_QUERY>
```

Output Transaction:

The transaction succeeds in finding and retrieving an 'Enabled' authorization role named 'Dispatcher'.

```
<RESPONSE_AUTHORIZATION_ROLE_QUERY>
  <TRANSACTION_AUTHORIZATION_ROLE_QUERY>
    <AuthorizationRoleQueryRecord>
      <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
      <AuthorizationRole>Dispatcher</AuthorizationRole>
    </AuthorizationRoleQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_ROLE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>Number of authorization role records matching the given query: 1.
  </Description>
</ResultRecord>
  <AuthorizationRoleRecord>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
    <AuthorizationRoleDescription>Used for normal dispatch and close operations.
  </AuthorizationRoleDescription>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
  </AuthorizationRoleRecord>
</RESPONSE_AUTHORIZATION_ROLE_QUERY>
```

2.8.2 Authorization XML File Transactions - Authorization Roles Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the authorization roles table matching the given query condition. This transaction uses the same format as the Authorization Roles Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
  <AuthorizationRoleQueryRecord>
    <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
    <AuthorizationRole>Dispatcher</AuthorizationRole>
  </AuthorizationRoleQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_ROLE_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
    <AuthorizationRoleQueryRecord>
      <IfAuthorizationRoleEnabled>true</IfAuthorizationRoleEnabled>
      <AuthorizationRole>Dispatcher</AuthorizationRole>
    </AuthorizationRoleQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_ROLE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization role records matching the given query: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_AUTHORIZATION_ROLE_QUERY_COUNT>
```

2.8.3 Authorization XML File Transactions - Authorization Operation Names Table Query

CenTran Programming Reference Manual

This transaction queries the authorization operation names table for a set of authorization operation name records. The query record passed contains a set of operation names fields to create a query from. This query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization operation names records in the operation names table are retrieved.

- Authorization Operation Name
- Authorization Operation Category
- Dispatcher ID - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the operation names records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization operation names table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
  <AuthorizationOperationQueryRecord>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
```

Output Transaction:

The transaction succeeds and all Customer operations are retrieved.

```
<RESPONSE_AUTHORIZATION_OPERATION_QUERY>
  <TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
    <AuthorizationOperationQueryRecord>
      <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
    </AuthorizationOperationQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_OPERATION_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization operation name records matching the given query:
6.</Description>
  </ResultRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Add Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Customer Table Query</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Delete Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Read Customer Data</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Rename Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
  <AuthorizationOperationRecord>
    <AuthorizationOperationName>Update Customer</AuthorizationOperationName>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationRecord>
</RESPONSE_AUTHORIZATION_OPERATION_QUERY>
```

2.8.4 Authorization XML File Transactions - Authorization Operation Names Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the operation names table matching the given query condition. This transaction uses the same format as the Authorization Operation Names Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <AuthorizationOperationQueryRecord>
    <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
  </AuthorizationOperationQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
    <AuthorizationOperationQueryRecord>
      <AuthorizationOperationCategory>Customer</AuthorizationOperationCategory>
    </AuthorizationOperationQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_OPERATION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization operation name records matching the given query:
6.</Description>
  </ResultRecord>
  <QueryCount>6</QueryCount>
</RESPONSE_AUTHORIZATION_OPERATION_QUERY_COUNT>
```

2.8.5 Authorization XML File Transactions - Authorization Definition Table Query

CenTran Programming Reference Manual

This transaction queries the authorization definition table for a set of authorization definition records. The query record passed contains a set of definition fields to create a query from. The authorization definition query does not have a 'search like' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the authorization definition records in the definition table are retrieved.

- Authority Role
- Operation Name
- Operation Type
- Operation Parameter 1
- Dispatcher ID - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the authorization definition records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open authorization definition table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
  <AuthorizationDefinitionQueryRecord>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
  </AuthorizationDefinitionQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
```

Output Transaction:

The transaction successfully retrieves all the roles authorized to activate a lock in FLM mode.

```
<RESPONSE_AUTHORIZATION_DEFINITION_QUERY>
  <TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
    <AuthorizationDefinitionQueryRecord>
      <AuthorizationOperationType>FLM</AuthorizationOperationType>
      <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    </AuthorizationDefinitionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_DEFINITION_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of authorization definition records matching the given query: 3.
  </Description>
  </ResultRecord>
  <AuthorizationDefinitionRecord>
    <AuthorizationRole>Activate Only</AuthorizationRole>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationParameter1/>
  </AuthorizationDefinitionRecord>
  <AuthorizationDefinitionRecord>
    <AuthorizationRole>F/R Mode Basic Functions</AuthorizationRole>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationParameter1/>
  </AuthorizationDefinitionRecord>
  <AuthorizationDefinitionRecord>
    <AuthorizationRole>Supervisor</AuthorizationRole>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationParameter1/>
  </AuthorizationDefinitionRecord>
</RESPONSE_AUTHORIZATION_DEFINITION_QUERY>
```

2.8.6 Authorization XML File Transactions - Authorization Definition Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the authorization definition table matching the given query condition. This transaction uses the same format as the Authorization Definition Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <AuthorizationDefinitionQueryRecord>
    <AuthorizationOperationType>FLM</AuthorizationOperationType>
    <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
  </AuthorizationDefinitionQueryRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
    <AuthorizationDefinitionQueryRecord>
      <AuthorizationOperationType>FLM</AuthorizationOperationType>
      <AuthorizationOperationName>Activate Lock</AuthorizationOperationName>
    </AuthorizationDefinitionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_AUTHORIZATION_DEFINITION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Number of audit records matching the given query: 3.</Description>
  </ResultRecord>
  <QueryCount>3</QueryCount>
</RESPONSE_AUTHORIZATION_DEFINITION_QUERY_COUNT>
```

2.9.1 Region XML File Transactions - Add Region

CenTran Programming Reference Manual

This transaction adds a region to the Cencon database region table. The region name must be a unique value.

Both locks and users can be assigned to a region. If a region has assigned locks and users, it can't be deleted.

If region control is set to be active in the Cencon system, then regions are used to restrict what data can be seen by those dispatch users without authorization to view information outside of their assigned region. Additionally, lock users can only be dispatched or assigned to locks within the same assigned region.

The Cencon system has two aspects of authorization. The first is the concept of authorization roles, which restricts what operations or transactions a user can do. The second is the concept of regions, which restricts what set of information a user has access to or what locks a lock user can be dispatched / assigned to. Region control can be set on or off, depending on your operational requirements.

There are two basic categories of users in the Cencon system. The first basic category is the lock users (FLM / Route / Bank) who are dispatched to open locks, or are assigned to be able to open a lock in bank mode. The second basic category is the Cencon / CenTran logon users, which can log onto either Cencon or access CenTran to do management and lock dispatch operations.

Region control affects the category of lock users by restricting what locks the users can be dispatched or assigned to.

Region control affects the category of Cencon / CenTran logon users by restricting what locks and users the log on user can view in Cencon or do operations to.

Individual regions have a flag associated with it, called region type. If the region type is 0, or regional, then the region affects both lock users and Cencon / CenTran logon users. If the region type is 1, or global, then the region affects lock users being dispatched / assigned to locks in the same region, but does not affect Cencon / CenTran logon users being able to view or manage information.

Having a region that is set as global, with a region type of 1, allows you to have a region assigned to Cencon / CenTran log on users at your corporate headquarters that are not restricted by region control. The region control affects lock users and locks in the same way, and affects Cencon / CenTran log on users in other regions in the same way, but your Cencon / CenTran log on users assigned to a region set as global are not affected.

Transaction information required:

- Region Name (Unique 64 character identifier)
- Region Type (1 is global, 0 is regional) (Optional, defaults to 0, regional)
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region already exists
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_ADD_REGION>
  <RegionRecord>
    <RegionName>Frankfort</RegionName>
  </RegionRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_REGION>
```

Output Transaction:

The region is added successfully to the customer table in the database. The output transaction has the original input transaction (TRANSACTION_ADD_REGION) and a result record (indicating success).

```
<RESPONSE_ADD_REGION>
  <TRANSACTION_ADD_REGION>
    <RegionRecord>
      <RegionName>Frankfort</RegionName>
    </RegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Region Frankfort successfully added to the database.</Description>
  </ResultRecord>
</RESPONSE_ADD_REGION>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_ADD_REGION>
  <RegionRecord>
```

```
<RegionName>Kentucky</RegionName>
</RegionRecord>
<DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_ADD_REGION>
```

Output Transaction:

In this example, the region Kentucky already exists in the region table and therefore the transaction fails.

```
<RESPONSE_ADD_REGION>
  <TRANSACTION_ADD_REGION>
    <RegionRecord>
      <RegionName>Kentucky</RegionName>
    </RegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ADD_REGION_ALREADY_EXISTS</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Region Kentucky already exists.</Description>
  </ResultRecord>
</RESPONSE_ADD_REGION>
```

2.9.2 Region XML File Transactions - Read Region

CenTran Programming Reference Manual

This transaction reads a region from the database.

Transaction information required:

- Region Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the customer record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Region does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_READ_REGION>
  <RegionName>Kentucky</RegionName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_READ_REGION>
```

Output Transaction:

```
<RESPONSE_READ_REGION>
  <TRANSACTION_READ_REGION>
    <RegionName>Kentucky</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Success</Description>
  </ResultRecord>
  <RegionRecord>
    <RegionName>KENTUCKY</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
</RESPONSE_READ_REGION>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_READ_REGION>
  <RegionName>Kentucky</RegionName>
  <DispatcherID>Auth test user</DispatcherID>
</TRANSACTION_READ_REGION>
```

Output Transaction:

Here, dispatcher **Auth test user** is not authorized to read region data.

```
<RESPONSE_READ_REGION>
  <TRANSACTION_READ_REGION>
    <RegionName>Kentucky</RegionName>
    <DispatcherID>Auth test user</DispatcherID>
  </TRANSACTION_READ_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Dispatcher not authorized to perform this operation: Read Region Data.
  </ResultRecord>
</RESPONSE_READ_REGION>
```

2.9.3 Region XML File Transactions - Update Region

CenTran Programming Reference Manual

This transaction updates data for an existing region in the database. The region fields to be updated have to be specified in the input transaction. Those region fields that are not specified in the input transaction will not be changed from their current values. The only region field that can be updated is the region type flag for global versus regional.

Transaction information required:

- Region Name
- Region Type (1 is global, 0 is regional) (Optional)
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated region record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region does not exist
- Not authorized due to authorization role

Example 1 - Success

Input Transaction:

```
<TRANSACTION_UPDATE_REGION>
  <UpdateRegionRecord>
    <RegionName>Kentucky</RegionName>
    <RegionType>1</RegionType>
  </UpdateRegionRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_REGION>
```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_UPDATE_REGION), a result record (indicating success) and the updated region record with new region type value.

```
<RESPONSE_UPDATE_REGION>
  <TRANSACTION_UPDATE_REGION>
    <UpdateRegionRecord>
      <RegionName>Kentucky</RegionName>
      <RegionType>1</RegionType>
    </UpdateRegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Region KENTUCKY successfully updated in the database.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_REGION>
```

Example 2 - Failure

Input Transaction:

```
<TRANSACTION_UPDATE_REGION>
  <UpdateRegionRecord>
    <RegionName>NoRegion</RegionName>
    <RegionType>1</RegionType>
  </UpdateRegionRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_UPDATE_REGION>
```

Output Transaction:

The transaction fails because the region NoRegion does not exist.

```
<RESPONSE_UPDATE_REGION>
  <TRANSACTION_UPDATE_REGION>
    <UpdateRegionRecord>
      <RegionName>NoRegion</RegionName>
      <RegionType>1</RegionType>
    </UpdateRegionRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find region NoRegion in the region table.</Description>
  </ResultRecord>
</RESPONSE_UPDATE_REGION>
```

2.9.4 Region XML File Transactions - Delete Region

CenTran Programming Reference Manual

This transaction deletes a region from the database.

Transaction information required:

- Region Name
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Invalid Region Name
- Region does not exist
- Not authorized due to authorization role

Example 1 - Failure

Input Transaction:

```
<TRANSACTION_DELETE_REGION>
  <RegionName>NoRegion</RegionName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_REGION>
```

Output Transaction:

```
<RESPONSE_DELETE_REGION>
  <TRANSACTION_DELETE_REGION>
    <RegionName>NoRegion</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_REGION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to find region NoRegion in the region table.</Description>
  </ResultRecord>
</RESPONSE_DELETE_REGION>
```

Example 2 - Success

Input Transaction:

```
<TRANSACTION_DELETE_REGION>
  <RegionName>North East Bank Region</RegionName>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_DELETE_REGION>
```

Output Transaction:

```
<RESPONSE_DELETE_REGION>
  <TRANSACTION_DELETE_REGION>
    <RegionName>North East Bank Region</RegionName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_REGION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Region North East Bank Region has been deleted successfully.</Description>
  </ResultRecord>
</RESPONSE_DELETE_REGION>
```

2.9.5 Region XML File Transactions - Region Table Query

CenTran Programming Reference Manual

This transaction queries the region table for a set of region records. The query record passed contains a set of region fields to create a query from. The region query does not have a 'like search' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the region records are retrieved from the region table.

- Region Name
- Region Type
- Dispatcher ID: If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the region records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation
- Database error - failed to open region table

Example 1 - Success

Input Transaction:

```
<TRANSACTION_REGION_QUERY>
  <RegionQueryRecord>
    <!-- int -->
    <RegionType>0</RegionType>
  </RegionQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_REGION_QUERY>
```

Output Transaction:

The transaction retrieves all regions of type global (as opposed to local).

```
<RESPONSE_REGION_QUERY>
  <TRANSACTION_REGION_QUERY xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RegionQueryRecord>
      <RegionType>0</RegionType>
    </RegionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_REGION_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Region record/s found satisfying the search condition.
    </Description>
  </ResultRecord>
  <RegionRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RegionName>Loomis</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
  <RegionRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RegionName>TestRegionA</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
  <RegionRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RegionName>TestRegionB</RegionName>
    <RegionType>0</RegionType>
  </RegionRecord>
</RESPONSE_REGION_QUERY>
```

2.9.6 Region XML File Transactions - Region Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the region table query matching the given query condition. This transaction uses the same format as the Region Table Query transaction.

Example 1 - Success

Input Transaction:

```
<TRANSACTION_REGION_QUERY_COUNT>
  <RegionQueryRecord>
    <!-- int -->
    <RegionType>0</RegionType>
  </RegionQueryRecord>
  <!-- char string -->
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_REGION_QUERY_COUNT >
```

Output Transaction:

```
<RESPONSE_REGION_QUERY_COUNT>
  <TRANSACTION_REGION_QUERY_COUNT xmlns="http://www.kaba-mas.com/CenTranTransac.xsd">
    <RegionQueryRecord>
      <RegionType>0</RegionType>
    </RegionQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_REGION_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of region record/s found satisfying the search condition: 3.
  </Description>
  </ResultRecord>
  <QueryCount>3</QueryCount>
</RESPONSE_REGION_QUERY_COUNT>
```

2.10.1 Remote Lock Management XML File Transactions - Query Lock Status Across Network

CenTran Programming Reference Manual

This transaction is used to query the hardware and operational status of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from Centran to read the lock status from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from Centran to read the lock status. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.

Failure:

- Result record indicating failure

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_STATUS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_STATUS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_STATUS>
  <TRANSACTION_LOCK_REMOTE_STATUS>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_STATUS>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Lock status queried from lock successfully.</Description>
  </ResultRecord>
  <LockRemoteStatusRecord>
    <ProductFamily>2</ProductFamily>
    <ProductCode>2</ProductCode>
    <MajorVersion>2</MajorVersion>
    <MinorVersion>0</MinorVersion>
    <BuildVersion>824</BuildVersion>
    <SerialNumber>001000107</SerialNumber>
    <IfDuressOpenInProgress>false</IfDuressOpenInProgress>
    <IfDelayedOpenInProgress>false</IfDelayedOpenInProgress>
    <IfBoltRetracted>false</IfBoltRetracted>
    <IfShelvedOpenInProgress>false</IfShelvedOpenInProgress>
    <IfLockOutInProgress>false</IfLockOutInProgress>
    <IfBoltExtendedDoorOpen>false</IfBoltExtendedDoorOpen>
    <IfRemoteDisable>false</IfRemoteDisable>
    <LockFLMModeActivationStatus>ActivateSingleUser</LockFLMModeActivationStatus>
    <IfLockFLMModeActive>true</IfLockFLMModeActive>
    <LockRouteModeActivationStatus>ActivateSingleUser</LockRouteModeActivationStatus>
    <IfLockRouteModeActive>true</IfLockRouteModeActive>
    <LockBankModeActivationStatus>ActivateSingleUser</LockBankModeActivationStatus>

2.10.2 Remote Lock Management XML File Transactions - Query Lock Audits Across Network

CenTran Programming Reference Manual

This transaction is used to query the audits, hardware and operational status of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from CenTran to read the lock audits from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from CenTran to read the lock audits. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.
- All audit records read from the lock

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Failure:

- Result record indicating failure

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_DOWNLOAD_AUDITS>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>

2.10.3 Remote Lock Management XML File Transactions - Evaluate Lock Event Across Network

CenTran Programming Reference Manual

This transaction is used to evaluate an event that has occurred at a Cencon Gen 2 or higher lock that is connected to a network IP address. The operational and hardware status is read from the lock, as well as any new audits that have occurred at the lock since the last time audits were read.

Any new audits from the lock are added to the Cencon database audit table. If a dispatch to the lock has resulted in the lock being opened and closed, the lock dispatch is closed out in the Cencon database. Any audits that indicate a possible error or intrusion into the lock are flagged in the Cencon database.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- Lock IP Address and Port - Specifies the lock to connect to from CenTran to evaluate the lock events from.
- Lock Communications ID - Specifies an alternate identification of a lock to connect to from CenTran to evaluate the lock events. This is to support alternate methods of handling remote communications with locks for various network topologies.
- Lock Communications Method - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Lock operational status record, prior to actions taken by CenTran
- Lock operational status record, following actions taken by CenTran
- Lock hardware status record
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database. This will include the lock mode status record prior to actions taken by CenTran and the lock mode status record following actions taken by CenTran.
- Any Cencon audits resulting from the action taken by CenTran to evaluate the lock event. This will generally be if a dispatch to the lock was closed out.
- Any new audits from the lock indicating the event that occurred.

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Failure:

- Result record indicating failure

Example 1: Evaluating a lock open event.

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
```

Output Transaction: Result of evaluating a lock open event.

```
<RESPONSE_LOCK_REMOTE_EVALUATE_EVENT>

```

Example 2: Evaluating a lock close event.

Example Input Transaction:

```

<TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>

```

Output Transaction: Result of evaluating a lock close event.

```

<RESPONSE_LOCK_REMOTE_EVALUATE_EVENT>
  <TRANSACTION_LOCK_REMOTE_EVALUATE_EVENT>
    <IPAddress>10.108.6.121:35005</IPAddress>

2.10.4 Remote Lock Management XML File Transactions - Activate Lock Across Network

CenTran Programming Reference Manual

This transaction is used to activate a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to activate.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to activate. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.
- **Activate Lock Serial Record** - Specifies the information to used activate the lock.

Activate Lock Serial Record:

- **Lock Name** - Lock name and mode is a unique identifier for a lock record. The lock name can be up to 64 characters. This is a required field.
- **Lock Mode** - The lock mode identifies a mode on a lock. This is a required field. It can be one of the following values:
 - **F** - This indicates FLM (First Line Maintenance) mode. This is a dispatched lock mode, supporting a single dispatch at a time. FLM lock users are dispatched a one time combination to open the lock with a specific electronic key.
 - **R** - This indicates Route mode. This is a dispatched lock mode, supporting up to three dispatches at a time. Route lock users are dispatched a one time combination to open the lock with a specific electronic key.
 - **B** - This indicates Bank mode. This lock mode uses a table of up to 100 bank mode users for a Cencon Gen 2 lock. Bank lock users must be added to the lock user table to be allowed to open the lock. Each Bank lock user can set their own fixed combination for opening the lock.
- **Serial Number** - This is the serial number of the lock being activated. This serial number must match the lock being activated, or the activation will not be permitted. This value can be retrieved from the lock by remote communications or by doing a #2 keypad command at the lock. This is a required field. Serial number and mode is another unique identifier for a lock record.
- **If Dual Mode** - This flag indicates if the lock requires a single user or dual users to open the lock. This setting can be changed after lock activation using the Lock Remote Set Single Dual Access transaction. This is a required field. Possible values for this field are 1, true, 0, false.
- **Customer ID** - This is a 64 character field to identify a customer ID. The customer ID is a unique identifier for a customer record in the Cencon database. This field can be left blank. If this value is set, it must match a valid Customer ID entry in the Cencon database Customer table.
- **ATM Serial Number** - This is a 64 character field to identify an ATM serial number. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 1** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 2** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 3** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Description 4** - This is a 40 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 1** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 2** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 3** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **User Defined 4** - This is a 64 character field to associate descriptive information with the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Region** - This is a 64 character field to associate a region with the lock and mode. The region name must match an existing region record in the Cencon database. If region control is set to active for the Cencon system, then region is used to restrict what Cencon/CenTran dispatch users can view the lock in reports. It also restricts what lock users can be dispatched or assigned to the lock. If an FLM or Route lock user is associated with a different region, then they are not permitted to be dispatched to the lock. If a Bank lock user is associated with a different region, then they are not permitted to be added to the lock user table for Bank mode. This is an optional field, however if region control is active you will need to specify a region.
- **Service Branch** - This is a 64 character field to identify a service branch for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Address 1** - This is a 128 character field to allow an address to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Address 2** - This is a 128 character field to allow an address to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **City** - This is a 64 character field to allow a city to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **State** - This is a 32 character field to allow a state to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **ZIP** - This is a 16 character field to allow a postal service ZIP code to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Country** - This is a 32 character field to allow a country to be set for the lock. This field can be left blank. This optional field can be used as needed for managing operations with the Cencon system.
- **Time Zone ID** - This is a 64 character field to set the time zone ID for the lock. This field can be left blank. If this field is populated, the time zone ID must exactly match an operating system time zone ID, or an error will occur. If this field is left blank, the CenTran server local time zone will automatically be used. This field is used to identify the time zone ID for the lock. The lock time zone ID is used to generate the daylight savings time transition table for the lock when the lock time is set. It is used for the lock to determine local time depending on the current daylight savings time offset. This affects lock user time windows, if any, in relation to the current local time. The daylight savings time transition table is initialized by lock

mode, so it can be different for each lock mode. The lock daylight savings time transition table covers a period of 20 years. It is updated whenever the lock time is set. The lock daylight savings time transition table is generated from time zone information from the operating system, so if the operating system is out of date, the daylight savings time settings may be affected.

- **Bank Branch Name** - The bank branch name only applies to bank mode of the lock. If you are activating the bank mode of a lock, then this field must be set to match an existing Bank Branch in the Cencon database. The bank mode users you assign to the lock must also be assigned to the same bank branch as the lock.
- **Bank Mode User Name Array** - The bank mode user name array only applies to bank mode of the lock. The bank mode user name array is an array of user names for bank mode lock users to be assigned the the lock. If you are activating a bank mode lock, you must provide at least two users to be initially assigned to the lock. The user names specified must match valid bank mode lock user keys that are assigned to the same bank branch as the lock. If region control is active, then the bank mode lock users must also be assigned to the same region as the lock.
- **Bank Open Delay** - The bank open delay only applies to bank mode of the lock. This is the number of minutes (from 1 to 99) that a user will have to wait, after entering a combination and inserting the Personal Identifier Key before the lock will open. If no Time Delay to Open is desired, set this field to 0. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Open Window** - The bank open window only applies to bank mode of the lock. The second part of activating with Time Delay is the Window to Open. This specifies the amount of time, in minutes (from 1 to 99), in which a user must re-insert their key to open the lock after the Time Delay has expired. If the lock is not opened before the Window to Open elapses, the lock resets and the combination(s) and key(s) must be repeated, the time delay elapsed and then the lock opened. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.

Transaction information returned:

Success:

- Result record indicating success
- Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Note

The Cencon Gen 2 lock supports daylight savings time changes through the use of a time offset transition table. This table contains up to 40 entries, which is sufficient for 20 years of operation with two transitions a year. This table is initialized for each lock mode when the lock mode is activated. It is also updated when the time is updated on the lock.

The daylight savings time transition table for the Cencon Gen 2 lock is generated from the selected time zone, using daylight saving time information from the host computer. If the time zone ID is not specified when activating a lock, then the currently set time zone on the host computer is used.

The following is a table of available time zone IDs for the Windows operating system using English. Other language installations may make use of different language time zone IDs.

Windows Time Zone IDs:

UTC Offset	Time Zone ID
-12:00:00	Dateline Standard Time
-11:00:00	UTC-11
-10:00:00	Hawaiian Standard Time
-09:00:00	Alaskan Standard Time
-08:00:00	Pacific Standard Time (Mexico)
-08:00:00	Pacific Standard Time
-07:00:00	US Mountain Standard Time
-07:00:00	Mountain Standard Time (Mexico)
-07:00:00	Mountain Standard Time
-06:00:00	Central America Standard Time
-06:00:00	Central Standard Time
-06:00:00	Central Standard Time (Mexico)
-06:00:00	Canada Central Standard Time
-05:00:00	SA Pacific Standard Time
-05:00:00	Eastern Standard Time
-05:00:00	US Eastern Standard Time
-04:30:00	Venezuela Standard Time
-04:00:00	Paraguay Standard Time
-04:00:00	Atlantic Standard Time
-04:00:00	Central Brazilian Standard Time
-04:00:00	SA Western Standard Time
-04:00:00	Pacific SA Standard Time
-03:30:00	Newfoundland Standard Time

-03:00:00	E. South America Standard Time
-03:00:00	Argentina Standard Time
-03:00:00	SA Eastern Standard Time
-03:00:00	Greenland Standard Time
-03:00:00	Montevideo Standard Time
-03:00:00	Bahia Standard Time
-02:00:00	UTC-02
-02:00:00	Mid-Atlantic Standard Time
-01:00:00	Azores Standard Time
-01:00:00	Cape Verde Standard Time
00:00:00	Morocco Standard Time
00:00:00	UTC
00:00:00	GMT Standard Time
00:00:00	Greenwich Standard Time
01:00:00	W. Europe Standard Time
01:00:00	Central Europe Standard Time
01:00:00	Romance Standard Time
01:00:00	Central European Standard Time
01:00:00	W. Central Africa Standard Time
01:00:00	Namibia Standard Time

13:00:00	Samoa Standard Time
14:00:00	Line Islands Standard Time

Example - Activate FLM Mode

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_ACTIVATE>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <ActivateLockSerialRecord>
    <Country>USA</Country>
    <ZIP>40508-1200</ZIP>
    <State>Kentucky</State>
    <City>Lexington</City>
    <Address1>749 West Short Street</Address1>
    <ServiceBranch>North Service Branch</ServiceBranch>
    <Region>KENTUCKY</Region>
    <ATMSerialNumber>Kaba Mas ATM 1</ATMSerialNumber>
    <CustomerID>North Bank</CustomerID>
    <IfDualMode>>false</IfDualMode>
    <SerialNumber>1000107</SerialNumber>
    <LockMode>F</LockMode>
    <LockName>Gen2Lock 1000107</LockName>
  </ActivateLockSerialRecord>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_ACTIVATE>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_ACTIVATE>
