2.10.5 Remote Lock Management XML File Transactions - Add Users To Bank Mode Lock Across Network

CenTran Programming Reference Manual

This transaction is used to add users to the bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to add users to.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to add users to. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to add users to.
- **Lock Mode** - This is the lock mode of the lock that you are going to add users to. This transaction currently only applies to bank mode locks.
- **Bank Mode User Name Array** - This is an array of user IDs specifying what bank mode lock users to add to the lock. These must be valid existing bank mode lock users in the Cencon database. They must be assigned to the same bank branch as the lock. If region control is active, they must be assigned to the same region as the lock. They must not already be assigned to the lock. Additionally, the bank mode lock user table must have sufficient space for the added users. The Cencon Gen 2 bank mode can have up to 100 users assigned to it.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_ADD_USERS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>B</LockMode>
  <BankModeUserNameArray>
    <UserID>BU06</UserID>
    <UserID>BU07</UserID>
    <UserID>BU1000</UserID>
  </BankModeUserNameArray>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_ADD_USERS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_ADD_USERS>
  <TRANSACTION_LOCK_REMOTE_ADD_USERS>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>

2.10.6 Remote Lock Management XML File Transactions - Delete Users From Bank Mode Lock Across Network

CenTran Programming Reference Manual

This transaction is used to delete users from the bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to delete users from.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to delete users from. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to delete users from.
- **Lock Mode** - This is the lock mode of the lock that you are going to delete users from. This transaction currently only applies to bank mode locks.
- **Bank Mode User Name Array** - This is an array of user IDs specifying what bank mode lock users to delete from the lock. These must be valid existing bank mode lock users in the Cencon database. They must be assigned to the lock. Additionally, the Cencon Gen 2 lock is required to have two bank mode users set up. It is not permitted to delete the last two users from the Cencon Gen 2 lock bank mode.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_DELETE_USERS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>

2.10.7 Remote Lock Management XML File Transactions - Shelf Lock Across Network

CenTran Programming Reference Manual

This transaction is used to shelve a mode of a Cencon Gen 2 or higher lock that is connected to a network IP address. This transaction only shelves the specified lock mode. If other modes of the lock are active, they will not be affected by this transaction and will remain active. If all three modes of the lock are active, you will have to call this transaction three times to completely shelve all modes of the lock.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to shelve.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to shelve. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to shelve.
- **Lock Mode** - This is the lock mode of the lock that you are going to shelve.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Shelved Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Note

If the Cencon configuration option to require a change key be present in the lock for remote shelve is set, you will not be able to remotely shelve the lock across a remote connection without first having someone present to open the lock and insert a change key. In the case of the Cencon Gen 2 swing bolt lock, you can alternatively open the lock and enter #50 at the lock to allow remote administration of the lock. Refer to the Cencon application Change Configuration Settings dialog to set this configuration option in the Cencon database.

The error code **RC_ERR_SHELVE_LOCK_SERIAL_CHANGE_KEY_NOT_PRESENT** will be returned by CenTran if this error occurs.

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_SHELVE>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>B</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_SHELVE>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_SHELVE>
  <TRANSACTION_LOCK_REMOTE_SHELVE>
    <IPAddress>10.108.6.121:35005</IPAddress>

2.10.8 Remote Lock Management XML File Transactions - Set Lock Time Across Network

CenTran Programming Reference Manual

This transaction is used to set the lock time for a Cencon Gen 2 or higher lock that is connected to a network IP address, or the lock time and time zone daylight savings time transition table for a mode of such a lock. This transaction only sets the daylight savings time transition table for the specified lock mode. If other modes of the lock are active and you want to set the daylight savings time transition table for them as well, you will need to call this transaction for them also. If the lock name and mode are not specified, only the lock time will be set for the lock, and any specified time zone id will be ignored.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set lock time and time zone daylight savings time transition table.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set lock time and time zone daylight savings time transition table. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name and Mode** - Specifies the name and mode of the lock for which you are going to set the lock time and time zone daylight savings time transition table. This structure can be omitted. If this structure is present, the name and mode must match the lock at the specified network address. If this structure is omitted, only the time will be set for the lock.
 - **Lock Name** - This is the lock name of the lock for which you are going to set the lock time and time zone daylight savings time transition table.
 - **Lock Mode** - This is the lock mode of the lock for which you are going to set the lock time and time zone daylight savings time transition table.
- **Time Zone ID** - This is a 64 character field to set the time zone ID for the lock. This field can be left blank. If this field is populated, the time zone ID must exactly match an operating system time zone ID, or an error will occur. If this field is left blank, the CenTran server local time zone will automatically be used. This field is used to identify the time zone ID for the lock. The lock time zone ID is used to generate the daylight savings time transition table for the lock when the lock time is set. It is used for the lock to determine local time depending on the current daylight savings time offset. This affects lock user time windows, if any, in relation to the current local time. The daylight savings time transition table is initialized by lock mode, so it can be different for each lock mode. The lock daylight savings time transition table covers a period of 20 years. It is updated whenever the lock time is set. The lock daylight savings time transition table is generated from time zone information from the operating system, so if the operating system is out of date, the daylight savings time settings may be affected.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Examples

Example Input Transaction With Lock Name and Mode Specified:

```
<TRANSACTION_LOCK_REMOTE_SET_TIME>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockNameAndMode>
    <LockName>Gen2Lock_1000107</LockName>
    <LockMode>B</LockMode>
  </LockNameAndMode>
  <TimeZoneID>Central_Standard_Time</TimeZoneID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_SET_TIME>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_SET_TIME>
  <TRANSACTION_LOCK_REMOTE_SET_TIME>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID>
```

```

    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <LockNameAndMode>
      <LockName>Gen2Lock 1000107</LockName>
      <LockMode>B</LockMode>
    </LockNameAndMode>

2.10.9 Remote Lock Management XML File Transactions - Set Lock Single Dual Access Across Network

CenTran Programming Reference Manual

This transaction is used to set single or dual access of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set single or dual access.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set single or dual access. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to set single or dual access.
- **Lock Mode** - This is the lock mode of the lock that you are going to set single or dual access.
- **If Dual Mode** - This is a flag indicating that the lock is to be set to dual mode. If this flag is 1 or true, then the lock will be set to dual user access. If this flag is 0 or false, then the lock will be set to single user access.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock_1000107</LockName>
  <LockMode>F</LockMode>
  <IfDualMode>true</IfDualMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_SET_SINGLE_DUAL_ACCESS>
```

Output Transaction:

```

2.10.10 Remote Lock Management XML File Transactions - Set Lock Open Delay Window Across Network

CenTran Programming Reference Manual

This transaction is used to set the lock open delay and open time window of a bank mode Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to set the lock open delay and open time window.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to set the lock open delay and open time window. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to set the lock open delay and open time window.
- **Lock Mode** - This is the lock mode of the lock that you are going to set the lock open delay and open time window. This is currently always going to be bank mode. FLM and Route lock modes do not support an open delay and open time window.
- **Bank Open Delay** - This is an integer value representing the number of minutes of the bank mode open delay. If this value is set to 0 then the **Bank Open Window** must also be set to 0. If this value is set to some number of minutes greater than 0, then the **Bank Open Window** must also be set to some number of minutes greater than 0.

This delay will be applied to bank mode users attempting to open the lock. If the bank mode user enters a valid combination with a valid key and a bank mode open delay is set, then the lock will go into a wait state before allowing the same bank mode user to use their key again to open the lock. The **Bank Open Delay** defines how long in minutes the user has to wait before opening the lock.

- **Bank Open Window** - This is an integer value representing the number of minutes of the bank mode open window. If this value is set to 0 then the **Bank Open Delay** must also be set to 0. If this value is set to some number of minutes greater than 0, then the **Bank Open Delay** must also be set to some number of minutes greater than 0.

This open window will be applied to bank mode users attempting to open the lock. If the bank mode user enters a valid combination with a valid key and a bank mode open delay is set, then the lock will go into a wait state before allowing the same bank mode user to use their key again to open the lock. The **Bank Open Window** defines how long in minutes the user has to open the lock after the delay is complete.

- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_SET_OPEN_DELAY_WINDOW>
  <IPAddress>10.108.6.96:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>

2.10.11 Remote Lock Management XML File Transactions - Resynchronize Lock Dispatching Across Network

CenTran Programming Reference Manual

This transaction is used to resynchronize dispatching of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to resynchronize dispatching.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to resynchronize dispatching. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to resynchronize dispatching.
- **Lock Mode** - This is the lock mode of the lock that you are going to resynchronize dispatching. This transaction currently only applies to FLM and Route mode locks.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_RESYNC_DISPATCHING>
  <TRANSACTION_LOCK_REMOTE_RESYNC_DISPATCHING>

2.10.12 Remote Lock Management XML File Transactions - Resynchronize Bank Mode Lock Users Across Network

CenTran Programming Reference Manual

This transaction is used to resynchronize users for bank mode of a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to resynchronize users.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to resynchronize users. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to resynchronize users.
- **Lock Mode** - This is the lock mode of the lock that you are going to resynchronize users. This transaction currently only applies to Bank mode locks.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record
- Array of bank mode lock user IDs that were added to the lock data in the Cencon database
- Array of bank mode lock user IDs that were removed from the lock data in the Cencon database
- Array of bank mode lock user IDs that failed to be added to the lock data in the Cencon database. This may be because a user assigned to the lock no longer exists in the database.
- Array of bank mode lock user IDs that failed to be removed from the lock data in the Cencon database. This should not normally occur, but may happen because of a database error.

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_RESYNC_USERS>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2Lock_1000107</LockName>
  <LockMode>B</LockMode>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_RESYNC_USERS>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_RESYNC_USERS>
  <TRANSACTION_LOCK_REMOTE_RESYNC_USERS>

2.10.13 Remote Lock Management XML File Transactions - Cancel Dispatch and Advance To Next Lock Mode Combination Across Network

CenTran Programming Reference Manual

This transaction is used to cancel the dispatch of a mode of a Cencon Gen 2 or higher lock that is connected to a network IP address. It does this by checking the status of the lock to determine if the dispatched user has reached the lock and opened it. If the user has opened and closed the lock, this transaction closes out the dispatch and returns that the user already opened the lock. If the user has not opened the lock, then the combination for that mode of the lock is advanced to the next combination at the lock, and the dispatch is force closed in the Cencon database.

If this transaction is used and the lock is dispatched on one or more route sequences, each call to this transaction will cancel the dispatch for the next route sequence. If the lock was dispatched on route sequence 1, 2, and 3, then the first call will cancel the dispatch for route sequence 1, the second call will cancel the dispatch for route sequence 2, and the third call will cancel the dispatch for route sequence 3. If a route sequence is skipped, such as sequences 2 and 3 are the only ones dispatched, then sequence 1 will be dispatched and closed to prevent it from being used and the combination for the lock mode will be advanced.

If this transaction is used without a dispatched user, then the combination of the mode of the lock is advanced at the lock and in the Cencon database.

If this transaction is used and the lock is currently open, then an error will be returned.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to cancel dispatch and advance combination.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to cancel dispatch and advance combination. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to cancel dispatch and advance combination.
- **Lock Mode** - This is the lock mode of the lock that you are going to cancel dispatch and advance combination.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success
- Updated Lock record
- Lock status record
- Lock hardware status record
- Lock mode status record
- IfUserOpenedClosedLockDispatch flag - Indicates if the user has already opened and closed the dispatch to the lock.
- IfAdvancedToNextLockCombo - Indicates if the lock mode was advanced to it's next combination.
- IfCancelledDispatch - Indicates if a dispatch was canceled in the Cencon database.
- IfAffectedRouteSequence - Indicates if a route mode was affected for cancelling a dispatch.
- AffectedRouteSequence - Value of the route mode that was affected for cancelling a dispatch. If present, this could be a value from 1 to 3.
- IfDuressComboUsedOnOpen - If the user has already opened and closed the dispatch, this indicates if a duress combination was used.
- IfClockBatteryLowOrResetOnOpen - If the user has already opened and closed the dispatch, this indicates if the clock battery was low or reset upon lock being opened.
- LockLogRecord - If present, these are the lock log records found to be dispatched at the time of the transaction for the specified lock mode.
- CanceledLockLogRecord - If present, this is the lock log record closed out by the transaction.

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_CANCEL_DISPATCH>
  <IPAddress>10.108.6.108:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>

2.10.14 Remote Lock Management XML File Transactions - Input Dispatched Combination to Lock and Lock Prompt for User Key (IPI)

CenTran Programming Reference Manual

This transaction is used to input a currently dispatched combination to the remotely connected lock.

Upon receiving the combination, the lock checks if the specified lock mode is in a closed state. If the lock mode is not closed, if the bolt is retracted or the container door switch indicates open, then an error will be returned by the lock.

If the lock mode is closed and the lock is physically closed, the lock will return a success result and stop accepting further remote serial communications. Please note, a success result from the lock for this operation only means that the combination(s) have been accepted. It does not mean the combination(s) match the lock user key(s) or that the user has successfully opened the lock.

The lock will then prompt IPI for the first matching lock user key. The lock user present at the lock is required to present the matching lock user key to the lock key reader. If the combination matches with the key, the lock will open.

If the lock is in dual access mode, it will first prompt IPI for the first matching lock user key. After the first lock user key has been successfully presented, it will then prompt IP2 for the second lock user key. After the second lock user key has been successfully presented, the lock will compare the first combination with the first lock user key and the second combination with the second lock user key. If both combinations match the appropriate lock user key, the lock will open.

Caution

If the lock is in dual access mode, the lock user keys must be presented in the same order as specified in the dispatch of the users to the lock. If the keys are presented in reverse order to the lock, the comparison of the combinations to the keys will be reversed and the lock will display an error.

If this transaction is used and the lock is dispatched on one or more route sequences, a route sequence must be specified. This is the same as usage of route sequences by lock users dispatched on a route. The route sequence must be dispatched, and must be in the range of 1 to 3.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to input combination to.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to input combination to. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Lock Name** - This is the lock name of the lock that you are going to input combination to.
- **Lock Mode** - This is the lock mode of the lock that you are going to input combination to.
- **Route Sequence Number** - This is the route sequence number of the dispatch that you are going to input to the lock. This value should be 0 if not dispatched on a route. If dispatched on a route, it can be a value of 1 to 3.

Transaction information returned:

Success:

- Result record indicating success
- Lock record including dispatch information

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

Once the command to input a combination is successfully accepted by the lock, it will return back a success reply and then halt further remote communications. The lock will then begin prompting the user or users for their lock keys. After the lock has been opened, or the user has failed to successfully present the correct lock user key, the lock will reboot. After the lock has rebooted, it will be available for remote communications again.

Example

This example inputs the dispatched combination for **FLM** mode of a lock named **Gen2 Swingbolt 1158563** though a remote CenTran lock agent direct network connection: **10.108.6.104:35005**

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
  <IPAddress>10.108.6.104:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <LockName>Gen2 Swingbolt 1158563</LockName>
  <LockMode>F</LockMode>
  <LockSequence>0</LockSequence>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
```

Output Transaction:

```
<RESPONSE LOCK_REMOTE_INPUT_COMBO_IPI>
  <TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
    <IPAddress>10.108.6.104:35005</IPAddress>

Example - Failure due to lock open

This example inputs the dispatched combination for **Route** mode of a lock named **Gen2 Swingbolt 1158563** though a remote CenTran lock agent persistent network connection: **LockSerialNumber:1158563**

The lock is currently open and the operation results in a error being returned by the lock.

Example Input Transaction:

```

<TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
  <IPAddress/>
  <CommunicationsID>LockSerialNumber:1158563</CommunicationsID>
  <CommunicationsMethod>TcpClient</CommunicationsMethod>
  <LockName>Gen2 Swingbolt 1158563</LockName>
  <LockMode>R</LockMode>
  <LockSequence>0</LockSequence>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>

```

Output Transaction:

```

<RESPONSE_LOCK_REMOTE_INPUT_COMBO_IPI>
  <TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
    <IPAddress/>
    <CommunicationsID>LockSerialNumber:1158563</CommunicationsID>
    <CommunicationsMethod>TcpClient</CommunicationsMethod>
    <LockName>Gen2 Swingbolt 1158563</LockName>
    <LockMode>R</LockMode>
    <LockSequence>0</LockSequence>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_INPUT_COMBO_IPI>
  <ResultRecord>

</Description>
</ResultRecord>
</RESPONSE_LOCK_REMOTE_INPUT_COMBO_IPI>
```

2.10.15 Remote Lock Management XML File Transactions - Reboot Lock Across Network

CenTran Programming Reference Manual

This transaction is used to reboot a Cencon Gen 2 or higher lock that is connected to a network IP address.

The network connection to the lock can be through an ATM computer running the Cencon ATM Agent software, or through an ethernet to serial adapter for the Cencon lock.

Transaction information required:

- **Lock IP Address and Port** - Specifies the lock to connect to from CenTran to reboot.
- **Lock Communications ID** - Specifies an alternate identification of a lock to connect to from CenTran to reboot. This is to support alternate methods of handling remote communications with locks for various network topologies.
- **Lock Communications Method** - Specifies the method of communication to be used to communicate with the lock. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.
- **Dispatcher ID** - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

- Result record indicating success

Failure:

- Result record indicating failure

Note

When the Cencon Gen 2 lock starts up, it waits for either remote communications to start or for some form of user input. If some user input begins first, the lock will not respond to remote communications until the user operation at the lock is complete. If remote communications begins first, the lock will enter into communications mode and not exit communications until rebooted remotely or the communications times out without receiving data (around 20 seconds). While the lock is in communications mode, it will not respond to user input.

If you are doing remote communications to the lock and you have completed your operations with the lock, you should then reboot the lock so it is immediately available for user operations. Otherwise, anyone waiting on the lock will have to wait for the communications to time out (20 seconds).

Example

Example Input Transaction:

```
<TRANSACTION_LOCK_REMOTE_REBOOT>
  <IPAddress>10.108.6.121:35005</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_LOCK_REMOTE_REBOOT>
```

Output Transaction:

```
<RESPONSE_LOCK_REMOTE_REBOOT>
  <TRANSACTION_LOCK_REMOTE_REBOOT>
    <IPAddress>10.108.6.121:35005</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_REMOTE_REBOOT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Lock rebooted successfully.</Description>
  </ResultRecord>
</RESPONSE_LOCK_REMOTE_REBOOT>
```

3.1.1 Web Service CenTran Status - Version

CenTran Programming Reference Manual

This transaction is used to read the CenTran version and current server time.

Transaction information required:

- No information required.

Transaction information returned:

Success:

- Product name
- Version
- Major version number
- Minor version number
- Maintenance version number
- Build version number
- Server date and time based off of UTC
- Server date and time based off of Local Time
- Server time zone bias in minutes

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction Format:

```
https://{host}/CentranService/rest/version
```

Example Transaction:

```
https://kml-3242.domain.local/CentranService/rest/version
```

Example Output Transaction:

```
<RESPONSE_VERSION>
  <ProductName>Centran</ProductName>
  <Version>4.1.5.2621</Version>
  <MajorVersionNumber>4</MajorVersionNumber>
  <MinorVersionNumber>1</MinorVersionNumber>
  <MaintenanceVersionNumber>5</MaintenanceVersionNumber>
  <BuildVersionNumber>2621</BuildVersionNumber>
  <ServerDateTimeUTC>2012-04-16T16:25:11.1464266Z</ServerDateTimeUTC>
  <ServerDateTimeLocal>2012-04-16T12:25:11.1464266-04:00</ServerDateTimeLocal>
  <ServerTimeZoneBias>-240</ServerTimeZoneBias>
</RESPONSE_VERSION>
```

Example - JSON

Input Transaction Format:

```
https://{host}/CentranServiceJSON/rest/version
```

Example Transaction:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/version
```

Example Output Transaction:

```
{
  "buildVersionNumberField" : "3534" ,
  "maintenanceVersionNumberField" : "0" ,
  "majorVersionNumberField" : "5" ,
  "minorVersionNumberField" : "2" ,
  "productNameField" : "Centran" ,
  "serverDateTimeLocalField" : "\/Date(1408736886105-0400)\/" ,
  "serverDateTimeLocalFieldSpecified" : true ,
  "serverDateTimeUTCField" : "\/Date(1408736886105)\/" ,
  "serverDateTimeUTCFieldSpecified" : true ,
  "serverTimeZoneBiasField" : "-240" ,
  "versionField" : "5.2.0.3534 (64-Bit)"
}
```

3.1.2 Web Service CenTran Status - Available Time Zones

CenTran Programming Reference Manual

This transaction is used to read the CenTran server available time zone information.

Transaction information required:

- No information required.

Transaction information returned:

Success:

- ServerDateTimeUTC - Server Data / Time based on UTC (Coordinated Universal Time).
- ServerDateTimeLocal - Server Data / Time based on Server Local Time Zone.
- ServerTimeZoneBias - Server time zone bias in minutes. (This value can be positive or negative.)
- ServerTimeZoneID - Server time zone ID. This value is a unique identifier for the time zone the server has assigned.
- TimeZoneRecord - This is an array of zero or more records describing the time zone information available on the server.

TimeZoneRecord:

- TimeZoneBias - This is the time zone bias in minutes from the time zone local time to UTC. (Integer)
- TimeZoneDaylightName - This is the time zone name for daylight savings time. (String)
- TimeZoneDisplayName - This is the display name for the time zone. (String)
- TimeZoneID - This is a unique identifier for the time zone. This value is used with CenTran transactions to identify the time zone to use. (String)
- TimeZoneStandardName - This is the time zone name for standard time. (String)
- IfSupportsDaylightSavingTime - This boolean value is set to true if the time zone supports daylight savings time. (Boolean)

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction Format:

```
https://{host}/CentranService/rest/timezones
```

Example Transaction:

```
https://kml-3242.domain.local/CenTranService/rest/timezones
```

Example Output Transaction:

```

3.1.3 Web Service CenTran Status - Help

CenTran Programming Reference Manual

This transaction is used to read the CenTran web service help.

Transaction information required:

- No information required.

Transaction information returned:

Success:

An HTML based help page listing available information for the CenTran web service transactions.

Failure:

There should not be a failed return of data unless an internal error or connectivity error with CenTran has occurred.

Example

Input Transaction:

```
https://{host}/CentranService/rest/help
```

Output Transaction:

Operations at https://kml-3242/CentranService/rest/

This page describes the service operations at this endpoint.

Uri	Method	Description
*	OPTIONS	Authorizes cross-domain browser pre-flight checks
event/{eventid}	GET	Returns the audit data for the indicated event id.
hello	GET	Echoes the given name
lock/audits	POST	Returns audits by remotely accessing the lock at the given IP address
lock/close	POST	Closes the call for the specified lock by name and mode or serial number and mode with the given close seal number
lock/dispatch	POST	Dispatches the specified lock by name and mode or serial number and mode to the given user or users
lock/evaluate	POST	Evaluates and returns event and status information by remotely accessing the lock at the given IP address
lock/query	POST	Executes a database query against the Cencon lock table and returns the matching records. The number of records returned can be very large if the query is not specific.
lock/query-count	POST	Executes a database query against the Cencon lock table and returns the count of matching records.
lock/reassign	POST	Reassigns the specified lock by name and mode or serial number and mode to the given user or users
lock/rename	POST	Renames a lock based off of the given name and mode or serial number and mode
lock/status	POST	Returns status information by remotely accessing the lock at the given IP address
lock/unassign	POST	Unassigns the specified lock by name and mode or serial number and mode
lock/update	POST	Updates descriptive data for a lock based off of the given name and mode or the given serial number and mode
lock-names/{lockname}/{mode}/data	GET	Returns data for the specified lock by name
lock-serialnumbers/{serialnumber}/{mode}/data	GET	Returns data for the specified lock by serial number
log/query	POST	Executes a database query against the Cencon lock log table and returns the matching records. The number of records returned can be very large if the query is not specific.
log/query-count	POST	Executes a database query against the Cencon lock log table and returns the count of matching records.
log-archive/query	POST	Executes a database query against the Cencon lock log archive table and returns the matching records. The number of records returned can be very large if the query is not specific.
log-archive/query-count	POST	Executes a database query against the Cencon lock log archive table and returns the count of matching records.
log-history/query	POST	Executes a database query against the Cencon lock log history table and returns the matching records. The number of records returned can be very large if the query is not specific.
log-history/query-count	POST	Executes a database query against the Cencon lock log history table and returns the count of matching records.
log-names/{lockname}/{mode}/data	GET	Returns data for the specified lock by name from lock log
log-serialnumbers/{serialnumber}/{mode}/data	GET	Returns data for the specified lock by serial number from lock log
user/add_key	POST	Adds an FLM, Route, or Bank mode lock user key to the Cencon database, and writes to the user key at the specified network address.
user/change_name	POST	Changes the ID (Name) for the specified user.
user/delete	POST	Deletes an FLM, Route, or Bank mode lock user key from the Cencon database.
user/read_key	POST	Read an FLM, Route, or Bank mode lock user key at the specified network address.
user/update	POST	Updates user information in the Cencon database.
user/update_key	POST	Updates an FLM, Route, or Bank mode lock user key in the Cencon database, and writes to the user key at the specified network address.
user-ids/{userid}/data	GET	Returns data for the specified user by ID
user-keyserials/{cantype}/{keyid}/data	GET	Returns data for the specified user by key serial number
version	GET	Returns the product version information and server time for the web service

3.2.1 Web Service Lock Transactions - Dispatch Lock By Name

CenTran Programming Reference Manual

This transaction is used to dispatch the lock specified by lock name and mode to a lock user or users. This applies to FLM and Route modes only.

Transaction information required:

- Lock Name
- Lock Mode (F/R)
- First User Name
- Second User Name (Only if the lock is in dual user operation.)
- Flag indicating if dispatch is to be marked as second line maintenance call. (Optional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/dispatch
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/dispatch
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <User1ID>F3</User1ID>
  <User2ID/>
  <IfSecondLineMaintenanceCall>0</IfSecondLineMaintenanceCall>
  <DispatcherID/>
</TRANSACTION_DISPATCH_LOCK>
```

Example Output Transaction:

```
<RESPONSE_DISPATCH_LOCK>
  <TRANSACTION_DISPATCH_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <User1ID>F3</User1ID>
    <User2ID/>
    <IfSecondLineMaintenanceCall>0</IfSecondLineMaintenanceCall>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_LOCK>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran dispatch lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/dispatch
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/dispatch
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.2 Web Service Lock Transactions - Dispatch Lock By Serial Number

CenTran Programming Reference Manual

This transaction is used to dispatch the lock specified by lock serial number and mode to a lock user or users. This applies to FLM and Route modes only.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R)
- First User Name
- Second User Name (Only if the lock is in dual user operation.)
- Flag indicating if dispatch is to be marked as second line maintenance call. (Optional)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/dispatch
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/dispatch
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_LOCK>
  <SerialNumber>1000107</SerialNumber>
  <LockMode>F</LockMode>
  <User1ID>F3</User1ID>
  <User2ID/>
  <IfSecondLineMaintenanceCall>0</IfSecondLineMaintenanceCall>
  <DispatcherID/>
</TRANSACTION_DISPATCH_LOCK>
```

Example Output Transaction:

```
<RESPONSE_DISPATCH_LOCK>
  <TRANSACTION_DISPATCH_LOCK>
    <SerialNumber>1000107</SerialNumber>
    <LockMode>F</LockMode>
    <User1ID>F3</User1ID>
    <User2ID/>
    <IfSecondLineMaintenanceCall>0</IfSecondLineMaintenanceCall>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC OK</ErrorCode>
    <Description>The lock dispatch succeeded.</Description>
  </ResultRecord>
  <LockRecord>
    <LockName>Gen2Lock 1000107</LockName>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran dispatch lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/lock/dispatch
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/dispatch
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "ifSecondLineMaintenanceCallField" : false ,
  "ifSecondLineMaintenanceCallFieldSpecified" : true ,
  "itemElementNameField" : 1 ,
  "itemField" : "1037890" ,
  "lockModeField" : 0 ,
  "user1IDField" : "FLM SHA Key 6" ,
  "user2IDField" : null
}
```

Example Output Transaction - JSON:

3.2.3 Web Service Lock Transactions - Reassign Lock By Name

CenTran Programming Reference Manual

This transaction is used to reassign the lock specified by lock name and mode to a lock user or users. This applies to FLM and Route modes only.

Transaction information required:

- Lock Name
- Lock Mode (F/R)
- First User Name
- Second User Name (Only if the lock is in dual user operation.)
- Lock Sequence (Optional. This applies to route dispatches only. Can be set to 0 if not used, or is a range of 1 to 3 for a valid lock sequence.)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/reassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/reassign
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_REASSIGN_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <User1ID>F4</User1ID>
  <User2ID/>
  <LockSequence>0</LockSequence>
  <DispatcherID/>
</TRANSACTION_REASSIGN_LOCK>
```

Example Output Transaction:

```
<RESPONSE_REASSIGN_LOCK>
  <TRANSACTION_REASSIGN_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <User1ID>F4</User1ID>
    <User2ID/>
    <LockSequence>0</LockSequence>
    <DispatcherID/>
  </TRANSACTION_REASSIGN_LOCK>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran reassign lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/lock/reassign
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/reassign
```

Example Input Transaction (HTTP Body) - JSON:

```
{

3.2.4 Web Service Lock Transactions - Reassign Lock By Serial Number

CenTran Programming Reference Manual

This transaction is used to reassign the lock specified by lock serial number and mode to a lock user or users. This applies to FLM and Route modes only.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R)
- First User Name
- Second User Name (Only if the lock is in dual user operation.)
- Lock Sequence (Optional. This applies to route dispatches only. Can be set to 0 if not used, or is a range of 1 to 3 for a valid lock sequence.)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/reassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/reassign
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_REASSIGN_LOCK>
  <SerialNumber>1000107</SerialNumber>
  <LockMode>F</LockMode>
  <User1ID>F4</User1ID>
  <User2ID/>
  <LockSequence>0</LockSequence>
  <DispatcherID/>
</TRANSACTION_REASSIGN_LOCK>
```

Example Output Transaction:

```
<RESPONSE_REASSIGN_LOCK>
  <TRANSACTION_REASSIGN_LOCK>
    <SerialNumber>1000107</SerialNumber>
    <LockMode>F</LockMode>
    <User1ID>F4</User1ID>
    <User2ID/>
    <LockSequence>0</LockSequence>
    <DispatcherID/>
  </TRANSACTION_REASSIGN_LOCK>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran reassign lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/reassign
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/reassign
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 1 ,
  "itemField" : "1037890" ,
  "lockModeField" : 0 ,
  "lockSequenceField" : null ,

3.2.5 Web Service Lock Transactions - Unassign Lock By Name

CenTran Programming Reference Manual

This transaction is used to unassign the lock specified by lock name and mode. This applies to FLM mode only.

Transaction information required:

- Lock Name
- Lock Mode (F/R)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/unassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/unassign
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_UNASSIGN_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_UNASSIGN_LOCK>
```

Example Output Transaction:

```
<RESPONSE_UNASSIGN_LOCK>
  <TRANSACTION_UNASSIGN_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <DispatcherID/>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran dispatch lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/unassign
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/unassign
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 0 ,
  "itemField" : "Gen2 Swingbolt 1037890" ,
  "lockModeField" : 0
}
```

Example Output Transaction - JSON:

```

```

3.2.6 Web Service Lock Transactions - Unassign Lock By Serial Number

CenTran Programming Reference Manual

This transaction is used to unassign the lock specified by lock serial number and mode. This applies to FLM mode only.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/unassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/unassign
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_UNASSIGN_LOCK>
  <SerialNumber>1000107</SerialNumber>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_UNASSIGN_LOCK>
```

Example Output Transaction:

```
<RESPONSE_UNASSIGN_LOCK>
  <TRANSACTION_UNASSIGN_LOCK>
    <SerialNumber>1000107</SerialNumber>
    <LockMode>F</LockMode>
    <DispatcherID/>
  </TRANSACTION_UNASSIGN_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>The lock unassign succeeded. The unassigned users: F4</Description>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time

conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran dispatch lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/unassign
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/unassign
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 1 ,
  "itemField" : "1037890" ,
  "lockModeField" : 0
}
```

Example Output Transaction - JSON:

3.2.7 Web Service Lock Transactions - Close Lock By Name

CenTran Programming Reference Manual

This transaction is used to close the lock specified by lock name and mode using the given close seal. This applies to FLM and Route modes only.

Transaction information required:

- Lock Name
- Lock Mode (F/R)
- Close Seal (2 digits for Cencon Gen 1 locks, 4 digits for Cencon Gen 2 locks)
- Lock Sequence (Optional. This applies to route dispatches only. Can be set to 0 if not used, or is a range of 1 to 3 for a valid lock sequence.)
- Flag for is force close for skipped lock sequence (Optional. This applies to route dispatches only.)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/close
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/close
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_CLOSE_LOCK>
  <LockName>Gen2Lock 1000107</LockName>
  <LockMode>F</LockMode>
  <CloseSeal>1745</CloseSeal>
  <LockSequence>0</LockSequence>
  <IfForcedClosed>0</IfForcedClosed>
  <DispatcherID/>
</TRANSACTION_CLOSE_LOCK>
```

Example Output Transaction:

```
<RESPONSE_CLOSE_LOCK>
  <TRANSACTION_CLOSE_LOCK>
    <LockName>Gen2Lock 1000107</LockName>
    <LockMode>F</LockMode>
    <CloseSeal>1745</CloseSeal>
    <LockSequence>0</LockSequence>
    <IfForcedClosed>0</IfForcedClosed>
    <DispatcherID/>
  </TRANSACTION_CLOSE_LOCK>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran close lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/close
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/close
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "closeSealField" : "7528" ,
  "dispatcherIDField" : null ,
  "ifForcedClosedField" : false ,
  "ifForcedClosedFieldSpecified" : true ,
  "itemElementNameField" : 0 ,
  "itemField" : "Gen2 Swingbolt 1037890" ,
  "lockModeField" : 0 ,
  "lockSequenceField" : "0"
}
```

Example Output Transaction - JSON:

3.2.8 Web Service Lock Transactions - Close Lock By Serial Number

CenTran Programming Reference Manual

This transaction is used to close the lock specified by lock serial number and mode using the given close seal. This applies to FLM and Route modes only.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R)
- Close Seal (2 digits for Cencon Gen 1 locks, 4 digits for Cencon Gen 2 locks)
- Lock Sequence (Optional. This applies to route dispatches only. Can be set to 0 if not used, or is a range of 1 to 3 for a valid lock sequence.)
- Flag for is force close for skipped lock sequence (Optional. This applies to route dispatches only.)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/close
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/close
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_CLOSE_LOCK>
  <SerialNumber>I000107</SerialNumber>
  <LockMode>F</LockMode>
  <CloseSeal>1745</CloseSeal>
  <LockSequence>0</LockSequence>
  <IfForcedClosed>0</IfForcedClosed>
  <DispatcherID/>
</TRANSACTION_CLOSE_LOCK>
```

Example Output Transaction:

```
<RESPONSE_CLOSE_LOCK>
  <TRANSACTION_CLOSE_LOCK>
    <SerialNumber>I000107</SerialNumber>
    <LockMode>F</LockMode>
    <CloseSeal>1745</CloseSeal>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran close lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

`https://{host}/CentranServiceJSON/rest/lock/close`

Example Input Transaction (HTTP Post) - JSON:

`https://kml-3242.domain.local/CentranServiceJSON/rest/lock/close`

Example Input Transaction (HTTP Body) - JSON:

```
{
  "closeSealField" : "3607" ,

3.2.9 Web Service Lock Transactions - Read Lock Data By Name

CenTran Programming Reference Manual

This transaction is used to read the available Cencon database data for a lock based off of lock name and mode.

Transaction information required:

- Lock Name
- Lock Mode (F/R/B)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

LockRecord:

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Example

Input Transaction Format:

```
https://{host}/CentranService/rest/lock-names/{LOCKNAME}/{MODE}/data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/lock-names/VLK008/F/data
```

Example Output Transaction:

```
<RESPONSE READ_LOCK>
  <TRANSACTION_READ_LOCK>
    <LockName>VLK008</LockName>
    <LockMode>F</LockMode>
    <DispatcherID/>
  </TRANSACTION_READ_LOCK>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Get) - JSON:

https://{host}/CentranServiceJSON/rest/lock-names/{LOCKNAME}/{MODE}/data

Example Input Transaction (HTTP Get) - JSON:

https://kml-3242.domain.local/CenTranServiceJSON/rest/lock-names/VLK008/R/data

Example Output Transaction - JSON:

3.2.10 Web Service Lock Transactions - Read Lock Data By Serial Number

CenTran Programming Reference Manual

This transaction is used to read the available Cencon database data for a lock based off of lock serial number and mode.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R/B)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

LockRecord:

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Example

Input Transaction Format:

```
https://{host}/CentranService/rest/lock-serialnumbers/{SERIALNUMBER}/{MODE}/data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/lock-serialnumbers/532008/F/data
```

Example Output Transaction:

```
<RESPONSE READ_LOCK>
  <TRANSACTION_READ_LOCK>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock-serialnumbers/{SERIALNUMBER}/{MODE}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock-serialnumbers/1000116/B/data
```

Example Output Transaction - JSON:

```

3.2.11 Web Service Lock Transactions - Update Lock Data

CenTran Programming Reference Manual

This transaction is used to update data for the specified lock. The lock is specified by either lock serial number and mode or lock name and mode.

Transaction information required:

- Lock Name (LockName) or Lock Serial Number (SerialNumber)
- Lock Mode (F/R/B)
- Lock data to be updated:
 - GroupName
 - CustomerID
 - ATMSerialNumber
 - Description1
 - Description2
 - Description3
 - Description4
 - UserDefined1
 - UserDefined2
 - UserDefined3
 - UserDefined4
 - Region
 - ServiceBranch
 - Address1
 - Address2
 - City
 - State
 - ZIP
 - Country
 - TimeZoneID

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/update
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/update
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_UPDATE_LOCK>
  <UpdateLockRecord>
    <UserDefined4>Even more user defined items...</UserDefined4>
    <UserDefined3>More user defined items...</UserDefined3>
    <Description2>Event more new description...</Description2>
    <Description1>Some new description...</Description1>
    <LockMode>F</LockMode>
    <LockName>VLK008</LockName>
  </UpdateLockRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_LOCK>
```

Example Output Transaction:

```
<RESPONSE_UPDATE_LOCK>
  <TRANSACTION_UPDATE_LOCK>
    <UpdateLockRecord>
      <UserDefined4>Even more user defined items...</UserDefined4>
      <UserDefined3>More user defined items...</UserDefined3>
      <Description2>Event more new description...</Description2>
      <Description1>Some new description...</Description1>
      <LockMode>F</LockMode>
      <LockName>VLK008</LockName>
```

```

    </UpdateLockRecord>
    <DispatcherID/>
  </TRANSACTION_UPDATE_LOCK>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran update lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/update
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.12 Web Service Lock Transactions - Rename Lock

CenTran Programming Reference Manual

This transaction is used to rename the specified lock. The lock is specified by either lock serial number and mode or lock name and mode.

Transaction information required:

- Lock Name (LockName) or Lock Serial Number (SerialNumber)
- Lock Mode (F/R/B)
- New Lock Name

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/rename
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/rename
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_RENAME_LOCK>
  <LockName>VLK016</LockName>
  <LockMode>F</LockMode>
  <NewLockName>VLK-New Lock Name</NewLockName>
  <DispatcherID/>
</TRANSACTION_RENAME_LOCK>
```

Example Output Transaction:

```
<RESPONSE_RENAME_LOCK>
  <TRANSACTION_RENAME_LOCK>
    <LockName>VLK016</LockName>
    <LockMode>F</LockMode>
    <NewLockName>VLK-New Lock Name</NewLockName>
    <DispatcherID/>
  </TRANSACTION_RENAME_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>

```

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran rename lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/rename
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/rename
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 0 ,
  "itemField" : "Gen2Lock6" ,
  "lockModeField" : 0 ,
  "newLockNameField" : "My New Gen2Lock6 Name"
}
```

Example Output Transaction - JSON:

```

3.2.13 Web Service Lock Transactions - Delete Shelved Lock By Name

CenTran Programming Reference Manual

This transaction deletes a shelved lock from the Cencon database by lock name and mode. This is supported for shelved FLM, Route, or Bank mode locks. If the lock to be deleted is not in a shelved state, then the lock must first be shelved either using an SA key or by remote communications. This transaction deletes only one mode of a lock from the Cencon database. A lock can have up to three entries in the database, one for FLM, Route and Bank modes.

Transaction information required:

- Lock Name
- Lock Mode (F/R/B)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Deleted lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/delete
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/delete
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DELETE_LOCK>
  <LockName>VLK111</LockName>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_DELETE_LOCK>
```

Example Output Transaction:

```
<RESPONSE_DELETE_LOCK>
  <TRANSACTION_DELETE_LOCK>
    <LockName>VLK111</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_LOCK>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/delete
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 0 ,
  "itemField" : "VLK110" ,
  "lockModeField" : 1
}
```

Example Output Transaction - JSON:

```

```

3.2.14 Web Service Lock Transactions - Delete Shelved Lock By Serial Number

CenTran Programming Reference Manual

This transaction deletes a shelved lock from the Cencon database by lock serial number and mode. This is supported for shelved FLM, Route, or Bank mode locks. If the lock to be deleted is not in a shelved state, then the lock must first be shelved either using an SA key or by remote communications. This transaction deletes only one mode of a lock from the Cencon database. A lock can have up to three entries in the database, one for FLM, Route and Bank modes.

Transaction information required:

- Lock Serial Number
- Lock Mode (F/R/B)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Deleted lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/delete
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/delete
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DELETE_LOCK>
  <SerialNumber>532112</SerialNumber>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_DELETE_LOCK>
```

Example Output Transaction:

```
<RESPONSE_DELETE_LOCK>
  <TRANSACTION_DELETE_LOCK>
    <SerialNumber>532112</SerialNumber>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_LOCK>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete lock transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

itemElementNameField - Enumeration of itemField field contents:

Value	Enumerated Value	Meaning
0	LockName	itemField contains lock name.
1	SerialNumber	itemField contains lock serial number.

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/delete
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "itemElementNameField" : 1 ,
  "itemField" : "532110" ,
  "lockModeField" : 0
}
```

3.2.15 Web Service Lock Transactions - Lock Table Query

CenTran Programming Reference Manual

This transaction queries the lock table for a set of lock records. The query record in the input web service transaction body contains a set of lock fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Locks' form which searches for locks to be displayed in a lock report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock records in the lock table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Group Name
- Serial Number Minimum and Serial Number Maximum (these values specify a range)
- Lock mode
- If Dual Mode
- Customer Number
- Minimum Audit Count
- Start Date Range (Start Date Start and Start Date End dates)
- Last Used Date range (Last Used Date Start and Last Used Date End dates)
- Lock Status List (Locks in one or more of these modes – Active/Shelved/Install/Pending Shelve/Being Replaced)
- If Lock Open
- If Route Open
- If Unassigned Open Call
- If Forced Closed
- If Search Exact (If the value for this field is false, then like search is used).
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- Description
- User Defined
- Address 1
- Address 2
- City
- State
- ZIP
- Country
- Bank Branch Name
- Lock Type - Gen 1 or Gen 2

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

If the Boolean fields are not present in the query record, they are assumed to have a value of false. All the Boolean value fields start with the characters 'If'. This applies to all the query transactions.

For the Start Date Range and End Date Range search, both the lower and upper bounds for the search have to be specified i.e. both Start Date Start and Start Date End have to be specified. If only Start Date Start is specified in the query record, that search field will not have any effect on the result.

Similarly to the Date Range search, for the Serial Number range search, both the lower (Serial Number Minimum) and upper bounds (Serial Number Maximum) for the search have to be specified.

If string fields such as Address1, Description are left blank, those fields are left out of the search query i.e. CenTran does not search for lock records in which Address or Description field is empty. This applies to all the query transactions.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock table.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/query
```

Example Input Transaction (HTTP Post):

Example Input Transaction (HTTP Body):

```

<TRANSACTION_LOCK_QUERY>

Example 2 - Success but no records returned

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/query
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_LOCK_QUERY>
  <LockQueryRecord>
    <SerialNumberMinimum>555000</SerialNumberMinimum>
    <SerialNumberMaximum>500000</SerialNumberMaximum>
    <MinimumCountAudits>1000</MinimumCountAudits>
    <ListLockStatus>
      <LockStatus>P</LockStatus>
      <LockStatus>I</LockStatus>
      <LockStatus>R</LockStatus>
    </ListLockStatus>
    <IfSearchExact>1</IfSearchExact>
  </LockQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_QUERY>

```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ LOCK_QUERY), a result record indicating success (query was processed successfully) with a description field saying that no lock records were found to match the given search condition.

```

<RESPONSE_LOCK_QUERY>
  <TRANSACTION_LOCK_QUERY>
    <LockQueryRecord>
      <SerialNumberMinimum>555000</SerialNumberMinimum>
      <SerialNumberMaximum>500000</SerialNumberMaximum>

      <IfSearchExact>1</IfSearchExact>
    </LockQueryRecord>
    <DispatcherID/>
  </TRANSACTION_LOCK_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>No lock record found satisfying the search condition.</Description>
  </ResultRecord>
</RESPONSE_LOCK_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning

0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the lock table for any locks assigned an ATM serial number containing '1167'. All three modes of lock VLK1000109 are returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/query
```

3.2.16 Web Service Lock Transactions - Lock Table Query Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock table matching the given query condition. It operates in the same manner as the Lock Table Query transaction.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_QUERY_COUNT>
  <LockQueryRecord>
    <SerialNumberMinimum>555000</SerialNumberMinimum>
    <SerialNumberMaximum>500000</SerialNumberMaximum>
    <MinimumCountAudits>0</MinimumCountAudits>
    <StartDateStart>2003-04-30T00:00:00</StartDateStart>
    <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
    <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
    <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
    <ListLockStatus>
      <LockStatus>D</LockStatus>
    </ListLockStatus>
    <IfSearchExact>1</IfSearchExact>
  </LockQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_QUERY_COUNT>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_QUERY_COUNT>
  <TRANSACTION_LOCK_QUERY_COUNT>
    <LockQueryRecord>
      <SerialNumberMinimum>555000</SerialNumberMinimum>
      <SerialNumberMaximum>500000</SerialNumberMaximum>
      <MinimumCountAudits>0</MinimumCountAudits>
      <StartDateStart>2003-04-30T00:00:00</StartDateStart>
      <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
      <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
      <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
      <ListLockStatus>
        <LockStatus>D</LockStatus>
      </ListLockStatus>
      <IfSearchExact>1</IfSearchExact>
    </LockQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock records matching the given query: 2.</Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_LOCK_QUERY_COUNT>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/lock/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/lock/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_QUERY_COUNT>
  <LockQueryRecord>
    <SerialNumberMinimum>555000</SerialNumberMinimum>
    <SerialNumberMaximum>500000</SerialNumberMaximum>
    <MinimumCountAudits>0</MinimumCountAudits>
    <StartDateStart>2003-04-30T00:00:00</StartDateStart>
```

```

<StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
<LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
<LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
<ListLockStatus>
  <LockStatus>D</LockStatus>
</ListLockStatus>
<IfSearchExact>1</IfSearchExact>
</LockQueryRecord>
<DispatcherID/>
</TRANSACTION_LOCK_QUERY_COUNT>

```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_QUERY_COUNT), a result record (indicating failure) with an error code (RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION) and description. In this case, the dispatcher authenticated with the web service is not authorized to query a lock table.

```

<RESPONSE_LOCK_QUERY_COUNT>
  <TRANSACTION_LOCK_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <LockQueryRecord>
      <SerialNumberMinimum>555000</SerialNumberMinimum>
      <SerialNumberMaximum>500000</SerialNumberMaximum>
      <MinimumCountAudits>0</MinimumCountAudits>
      <StartDateStart>2003-04-30T00:00:00</StartDateStart>
      <StartDateEnd>2002-04-01T00:00:00</StartDateEnd>
      <LastUsedDateStart>2005-04-30T00:00:00</LastUsedDateStart>
      <LastUsedDateEnd>2004-04-01T00:00:00</LastUsedDateEnd>
      <ListLockStatus>
        <LockStatus>D</LockStatus>
      </ListLockStatus>
      <IfSearchExact>1</IfSearchExact>
    </LockQueryRecord>
    <DispatcherID>Test Auth user</DispatcherID>
  </TRANSACTION_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_NOT_AUTHORIZED_TO_DO_OPERATION</ErrorCode>
    <Description>Dispatcher not authorized to perform this operation: Lock Table Query.
  </Description>
  </ResultRecord>
</RESPONSE_LOCK_QUERY_COUNT>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the lock table for any locks assigned an ATM serial number containing '1167'. All three modes of lock VLK1000109 match having that ATM serial number, so the result is three.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.17 Web Service Lock Transactions - Read Lock Log Data By Name

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of an open lock, using a web service HTTP GET transaction. The lock name and mode are specified as part of the web service HTTP GET transaction. There is no HTTP message body required by the request.

Transaction information required:

- Lock Name
- Lock Mode

Notes

If the dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region. If the lock is not assigned to the same region as the dispatcher, then the lock log data will be reported as not found.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Input Transaction Format (HTTP GET):

```
https://{host}/CentranService/rest/log-names/{lockname}/{mode}/data
```

Example Input Transaction (HTTP GET):

```
https://kml-3242.domain.local/CentranService/rest/log-names/VLK016/R/data
```

Example Output Transaction (HTTP Body):

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_READ_LOCK), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE LOCK LOG READ LOCK>
  <TRANSACTION_LOCK_LOG_READ_LOCK>
    <LockName>VLK016</LockName>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock log by name transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example reads any lock log entries for a lock named VLK019, in route mode. The lock is dispatched on a route for route sequence 1, 2, and 3.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-names/{lockname}/{mode}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-names/VLK019/R/data
```

Example Output Transaction - JSON:

```

{
  "lockLogRecordField" :

3.2.18 Web Service Lock Transactions - Read Lock Log Data By Serial Number

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of an open lock, using a web service HTTP GET transaction. The lock serial number and mode are specified as part of the web service HTTP GET transaction. There is no HTTP message body required by the request.

Transaction information required:

- Lock Serial Number
- Lock Mode

Notes

If the dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region. If the lock is not assigned to the same region as the dispatcher, then the lock log data will be reported as not found.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Input Transaction Format (HTTP GET):

```
https://{host}/CentranService/rest/log-serialnumbers/{serialnumber}/{mode}/data
```

Example Input Transaction (HTTP GET):

```
https://kml-3242.domain.local/CentranService/rest/log-serialnumbers/532019/R/data
```

Example Output Transaction (HTTP Body):

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_READ_LOCK), a result record (indicating success) and the lock log records matching the search query.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock log by serial number transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example reads any lock log entries for lock serial number 532009, in route mode. The lock is dispatched on a route for route sequence 1 and 2.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-serialnumbers/{serialnumber}/{mode}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-serialnumbers/532009/R/data
```

Example Output Transaction - JSON:

```
{
  "lockLogRecordField" :
  [
    {

```

3.2.19 Web Service Lock Transactions - Lock Log Table Query

CenTran Programming Reference Manual

This transaction queries the lock log table for a set of lock log records of open locks. The input web service transaction body contains a query record which in turn contains a set of lock log fields to create a query from. The query record also contains a flag indicating if to use like search or exact search. The query transaction attempts to work in a similar fashion as Cencon's 'Find Open Locks' form to search for open locks to be displayed in a lock log report.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock log records in the lock log table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Route Name
- Group Name
- Lock Mode
- If Dual Mode
- Customer Number
- Open Date range (Open Date Start and Open Date End dates)
- Close Date range (Close Date Start and Close Date End dates)
- If Unassigned Open Call
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- If Search Exact (If the value for this field is false, then like search is used)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

For the Open Date Range and Close Date Range search, the lower and upper bounds for the search can be specified independently i.e. Open Date Start may be specified in the query record while Open Date End may be left out and vice versa.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log table.

Example - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_QUERY>
  <LockLogQueryRecord>
    <LockName>Test</LockName>
    <UserID>rzjill</UserID>
    <GroupName></GroupName>
    <RouteName>TestRte5</RouteName>
    <LockMode>R</LockMode>
    <IfDualMode>0</IfDualMode>
    <CustomerNumber>0</CustomerNumber>
    <OpenDateStart>2004-04-01T00:00:00</OpenDateStart>
    <OpenDateEnd>2005-04-30T00:00:00</OpenDateEnd>
    <IfUnassignedOpenCall>0</IfUnassignedOpenCall>
    <CustomerID></CustomerID>
    <ATMSerialNumber></ATMSerialNumber>
    <Region>TestRegionD</Region>
    <ServiceBranch></ServiceBranch>
    <IfSearchExact>0</IfSearchExact>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_QUERY>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_QUERY), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE_LOCK_LOG_QUERY>
  <TRANSACTION_LOCK_LOG_QUERY>
    <LockLogQueryRecord>
      <LockName>Test</LockName>
      <UserID>rzjill</UserID>
      <GroupName></GroupName>
      <RouteName>TestRte5</RouteName>
      <LockMode>R</LockMode>
      <IfDualMode>0</IfDualMode>
      <CustomerNumber>0</CustomerNumber>
      <OpenDateStart>2004-04-01T00:00:00</OpenDateStart>
      <OpenDateEnd>2005-04-30T00:00:00</OpenDateEnd>
      <IfUnassignedOpenCall>0</IfUnassignedOpenCall>
      <CustomerID></CustomerID>
      <ATMSerialNumber></ATMSerialNumber>
      <Region>TestRegionD</Region>
      <ServiceBranch></ServiceBranch>
      <IfSearchExact>0</IfSearchExact>

  <Region>TestRegionD</Region>
  <IfUnassignedOpenCall>0</IfUnassignedOpenCall>
  <ServiceBranch />
</LockLogRecord>
</RESPONSE_LOCK_LOG_QUERY>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.

1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example queries the lock log table for any open dispatches for lock VLK019. The lock dispatches for Route mode sequences 1, 2, and 3 are returned for lock VLK019.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.20 Web Service Lock Transactions - Lock Log Table Query Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log table matching the given query condition. It operates in the same manner as the Lock Log Table Query transaction.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_QUERY_COUNT>
  <LockLogQueryRecord>
    <SerialNumberMaximum>532016</SerialNumberMaximum>
    <SerialNumberMinimum>532000</SerialNumberMinimum>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_QUERY_COUNT>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_QUERY_COUNT>
    <LockLogQueryRecord>
      <SerialNumberMaximum>532016</SerialNumberMaximum>
      <SerialNumberMinimum>532000</SerialNumberMinimum>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock records matching the given query: 10.</Description>
  </ResultRecord>
  <QueryCount>10</QueryCount>
</RESPONSE_LOCK_LOG_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log query count transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the lock log table for a count of any open dispatches for lock VLK019. A record count of 3 for VLK019 Route mode sequences 1, 2, and 3 is returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,

```

3.2.21 Web Service Lock Transactions - Lock Log History Table Query

CenTran Programming Reference Manual

This transaction queries the lock log history table for a set of lock log records resulting from previous opens and closes of locks. The input web service transaction body contains a query record which in turn contains a set of lock log fields to create a query from. The query record also contains a flag indicating if to use like search or exact search.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock log records in the lock log history table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Route Name
- Group Name
- Lock Mode
- If Dual Mode
- Customer Number
- Open Date range (Open Date Start and Open Date End dates)
- Close Date range (Close Date Start and Close Date End dates)
- If Unassigned Open Call
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- If Search Exact (If the value for this field is false, then like search is used)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

For the Open Date Range and Close Date Range search, the lower and upper bounds for the search can be specified independently i.e. Open Date Start may be specified in the query record while Open Date End may be left out and vice versa.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log history table.

Example - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log-history/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log-history/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_HISTORY_QUERY>
  <LockLogQueryRecord>
    <OpenDateStart>2012-04-10T00:00:00</OpenDateStart>
    <UserID>F3</UserID>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_HISTORY_QUERY>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_HISTORY_QUERY), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE_LOCK_LOG_HISTORY_QUERY>
  <TRANSACTION_LOCK_LOG_HISTORY_QUERY>
    <LockLogQueryRecord>
      <OpenDateStart>2012-04-10T00:00:00</OpenDateStart>
      <UserID>F3</UserID>
    </LockLogQueryRecord>
```

```

    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_HISTORY_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock log records matching the given query: 2.</Description>
  </ResultRecord>

    <Region>KENTUCKY</Region>
    <IfUnassignedOpenCall>>false</IfUnassignedOpenCall>
    <ServiceBranch>My new service branch</ServiceBranch>
  </LockLogRecord>
</RESPONSE_LOCK_LOG_HISTORY_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log history query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.

1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example queries the lock log history table for the dispatch history of lock VLK019. 12 previous dispatches of lock VLK019 is returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-history/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-history/query
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.22 Web Service Lock Transactions - Lock Log History Table Query Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log history table matching the given query condition. It operates in the same manner as the Lock Log Table Query transaction.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log-history/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log-history/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
  <LockLogQueryRecord>
    <IfDispatchedOnRoute>true</IfDispatchedOnRoute>
    <DispatchID>CENTRAN</DispatchID>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_HISTORY_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
    <LockLogQueryRecord>
      <IfDispatchedOnRoute>true</IfDispatchedOnRoute>
      <DispatchID>CENTRAN</DispatchID>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_HISTORY_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock records matching the given query: 86.</Description>
  </ResultRecord>
  <QueryCount>86</QueryCount>
</RESPONSE_LOCK_LOG_HISTORY_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This field is used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log history query count transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the lock log history table for the dispatch history of lock VLK019. 12 previous dispatches of lock VLK019 is returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-history/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-history/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "lockLogQueryRecordField" :
  {
    "aTMSerialNumberField" : null ,
    "closeDateEndField" : null ,
    "closeDateEndFieldSpecified" : false ,
    "closeDateStartField" : null ,
    "closeDateStartFieldSpecified" : false ,
    "customerIDField" : null ,
    "customerNumberField" : null ,
    "dispatchIDField" : null ,
    "groupNameField" : null ,
    "ifActivationCallField" : false ,
    "ifActivationCallFieldSpecified" : false ,

        "userIDField" : null
    }
}

```

3.2.23 Web Service Lock Transactions - Lock Log Archive Table Query

CenTran Programming Reference Manual

This transaction queries the lock log archive table for a set of lock log records of previous opens and closes of locks. The lock log archive table contains records that have been archived from the lock log history table. The input web service transaction body contains a query record which in turn contains a set of lock log fields to create a query from. The query record also contains a flag indicating if to use like search or exact search.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the lock log records in the lock log archive table are retrieved.

- Lock Name
- Dispatched User ID (searches for this User ID in both the FLM1ID and FLM2ID lock record fields)
- Route Name
- Group Name
- Lock Mode
- If Dual Mode
- Customer Number
- Open Date range (Open Date Start and Open Date End dates)
- Close Date range (Close Date Start and Close Date End dates)
- If Unassigned Open Call
- Customer ID
- ATM Serial Number
- Region
- Service Branch
- If Search Exact (If the value for this field is false, then like search is used)

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

If the Dispatcher belongs to a local region and region control is enabled, only those locks belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

For the Open Date Range and Close Date Range search, the lower and upper bounds for the search can be specified independently i.e. Open Date Start may be specified in the query record while Open Date End may be left out and vice versa.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the lock log records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open lock log archive table.

Example - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log-archive/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log-archive/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
  <LockLogQueryRecord>
    <RouteName>s_route2</RouteName>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_ARCHIVE_QUERY), a result record (indicating success) and the lock log records matching the search query.

```
<RESPONSE_LOCK_LOG_ARCHIVE_QUERY>
  <TRANSACTION_LOCK_LOG_ARCHIVE_QUERY>
    <LockLogQueryRecord>
      <RouteName>s_route2</RouteName>
    </LockLogQueryRecord>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log archive query transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example queries the lock log history table for the dispatch history of lock VLK103. 10 previous dispatches of lock VLK103 is returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-archive/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-archive/query
```

3.2.24 Web Service Lock Transactions - Lock Log Archive Table Query Count

CenTran Programming Reference Manual

This transaction returns the number of records in the lock log archive table matching the given query condition. It operates in the same manner as the Lock Log Table Query transaction.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/log-archive/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/log-archive/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <LockLogQueryRecord>
    <UserID>rzjane</UserID>
  </LockLogQueryRecord>
  <DispatcherID/>
</TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT), a result record (indicating success) and a field (QueryCount) having the exact query count.

```
<RESPONSE_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
    <LockLogQueryRecord>
      <UserID>rzjane</UserID>
    </LockLogQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_LOCK_LOG_ARCHIVE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of lock records matching the given query: 6.</Description>
  </ResultRecord>
  <QueryCount>6</QueryCount>
</RESPONSE_LOCK_LOG_ARCHIVE_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran lock log archive query count transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the lock log history table for the dispatch history of lock VLK103. 10 previous dispatches of lock

VLK103 is returned.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/log-archive/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/log-archive/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "lockLogQueryRecordField" :
  {
    "aTMSerialNumberField" : null ,
    "closeDateEndField" : null ,
    "closeDateEndFieldSpecified" : false ,
    "closeDateStartField" : null ,
    "closeDateStartFieldSpecified" : false ,

3.2.25 Web Service Lock Transactions - Initialize Lock SA Key for Audit Download

CenTran Programming Reference Manual

This transaction is used to initialize a lock SA key for audit download in the specified Cencon keybox.

Transaction information required:

- If Init for Bank Branch - Flag indicating if the lock SA key for audit download is to be initialized for a bank mode only lock. If so, the bank branch must be used to set up the security information on the lock SA key.
- Bank Branch Name - Specifies the bank branch to use if initializing the lock SA key for audit download for a bank mode only lock.
- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the key serial number information.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/init_sa_key_audit_download
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/init_sa_key_audit_download

    <Description>Initialize lock SA key for audit download succeeded.</Description>
  </ResultRecord>
  <KeyInformation>
    <KeyID>00000000AB5D5</KeyID>
    <CanType>0C</CanType>
  </KeyInformation>
</RESPONSE_INIT_LOCK_SA_KEY_AUDIT_DOWNLOAD>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock SA key for audit download transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the IPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example initializes a lock SA key for audit download through a remote keybox agent network connection:
10.108.6.103:53003

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/init_sa_key_audit_download
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/init_sa_key_audit_download
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "bankBranchNameField" : null ,
  "communicationsIDField" : null ,
  "communicationsMethodField" : 0 ,
  "dispatcherIDField" : null ,
  "IPAddressField" : "10.108.6.103:53003" ,
```

```

    "ifInitForBankBranchField" : false
}

```

Example Output Transaction - JSON:

```

{
  "keyInformationField" :
  {
    "canTypeField" :
    [
      12
    ] ,
    "keyIDField" :
    [
      0 ,
      0 ,
      0 ,
      10 ,
      181 ,
      213
    ]
  } ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Initialize lock SA key for audit download succeeded."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_INIT_LOCK_SA_KEY_AUDIT_DOWNLOADField" :
  {
    "bankBranchNameField" : null ,
    "communicationsIDField" : null ,
    "communicationsMethodField" : 0 ,
    "dispatcherIDField" : "CentranSS" ,
    "IPAddressField" : "10.108.6.103:53003" ,
    "ifInitForBankBranchField" : false
  }
}

```

3.2.26 Web Service Lock Transactions - Read Lock SA Key for Audit Download

CenTran Programming Reference Manual

This transaction is used to read the lock SA key for audit download in the specified Cencon keybox. It returns the current matching lock records from the Cencon database, lock activation / shelf records from the lock SA key, and returns the lock audit records from the lock SA key.

Transaction information required:

- IP Address and Port - Specifies the keybox to connect to from CenTran to read the key from.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Up to three records with lock mode status record and matching lock record data from the Cencon database, for each mode of the lock you have security access to in your Cencon database.
- An array of lock activate / shelf records read from the lock SA key
- An array of lock audit records read from the lock SA key

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock SA key for audit download.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Lock Activate / Shelf Data:

- Serial Number - This is the serial number for the lock involved in the activate / shelf event.
- Lock Mode - This is an identifier for the lock mode involved in the activate / shelf event. This will be F, R, B.
- LockActivateShelveEvent - This indicates if the event is an activate or a shelf. This will contain either Activate or Shelf.
- OriginatingLockMode - This indicates what originating lock mode was opened in order to activate this lock mode. This will be one of the other lock modes of the lock. If the lock was previously in a shelved (no modes activated) state, this will indicate that the mode was the first mode activated. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- ActivateShelveKey - This is the key model (can) type and key identifier of the lock SA key used to activate the lock mode. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- ActivateShelveDate - This is the date / time of the activate / shelf event in UTC based time.
- User1Key - This is the key model (can) type and key identifier of the first user of the originating lock mode that opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set.
- User1BankID - If the originating lock mode was bank mode, this is the bank mode user ID of the first user of the originating lock mode that opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications or if the originating lock mode was not bank mode, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User1Date - This is the date / time that the first user of the originating lock mode opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User1ID - This is the user ID looked up from the Cencon database for the first user of the originating lock mode opened the lock to activate this lock mode. If the lock mode was activated using remote serial communications, this field will not be set.
- User2Key - This is the key model (can) type and key identifier of the second user of the originating lock mode that opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2BankID - If the originating lock mode was bank mode, this is the bank mode user ID of the second user of the originating lock mode that opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications or if the originating lock mode was not bank mode, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2Date - This is the date / time that the second user of the originating lock mode opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- User2ID - This is the user ID looked up from the Cencon database for the second user of the originating lock mode opened the lock to activate this lock mode. If the originating lock mode was set for single access to open (not dual access), this field will not be set. If the lock mode was activated using remote serial communications, this field will not be set. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.
- AbbreviatedCompanyID - This value allows identification of what company activated a lock mode for loss prevention. Each set of company security information for the Cencon USB Key Box includes a unique numeric value to identify the company. This value is also copied to the lock when a lock mode is activated. The company can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

- AbbreviatedDeviceID - This value allows identification of what company Cencon USB Key Box activated a lock mode for loss prevention. Each set of company Cencon USB Key Box security information includes a unique numeric value to identify which Cencon USB Key Box was used to initialize the lock SA key for activating the lock. This value is copied to the lock when a lock mode is activated. The company Cencon USB Key Box can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

See [Appendix E - Lock Audit Data](#) for details of the lock audit information returned by CenTran.

Note

```

Example 2 - Failure: Unknown key

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/read_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/read_key
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_READ_USER_KEY>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_READ_USER_KEY>

```

Output Transaction:

In this example, the user key does not exist in the database.

```

<RESPONSE_READ_USER_KEY>
  <TRANSACTION_READ_USER_KEY>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_USER_NOT_FOUND</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>User key serial number being read was not found in database.</Description>
  </ResultRecord>
</RESPONSE_READ_USER_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value

for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock SA key for audit download transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

lockActivateShelveEventField - Lock Activate Shelve Event Enumeration:

Value	Enumerated Value	Meaning
0	Activated	Mode is activated
1	Shelved	Mode is shelved
2	NeverActivated	Mode has never been activated
3	invalid	Value is not set and is invalid

originatingLockModeField - Originating Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM mode was opened to activate the specified lock mode for the record.
1	R	Route mode was opened to activate the specified lock mode for the record.
2	B	Bank mode was opened to activate the specified lock mode for the record.
3	FirstActiveMode	Mode was activated from the lock being in a shelved state (no modes active).
4	invalid	Value is not set and is invalid

Example 2 - Read Lock SA Key for Audit Download from Cencon Gen 2 lock using CenTran JSON endpoint.

This example reads a lock SA key for audit download through a remote keybox agent network connection:
10.108.6.103:53003

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/read_sa_key_audit_download
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CenTranServiceJSON/rest/lock/read_sa_key_audit_download
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : null ,
  "communicationsMethodField" : 0 ,
  "dispatcherIDField" : null ,
  "iPAddressField" : "10.108.6.103:53003"
}
```

Example Output Transaction - JSON:

```
{
  "keyInformationField" :
  {
    "canTypeField" :
    [
      12
    ] ,
    "keyIDField" :

3.2.27 Web Service Lock Transactions - Initialize Lock SA Key for Activating Multiple Locks

CenTran Programming Reference Manual

This transaction is used to initialize a lock SA key for activating multiple locks in the specified Cencon keybox.

Transaction information required:

- **Activate Lock Serial Record** - An Activate Lock Serial Record is required for each lock being activated using the lock SA key. The details of this record are described in section [3.10.4 Activate Lock Across Network](#). Each lock mode being activated will require an Activate Lock Serial Record. In the case of Bank mode, this record also has an array of each Bank mode user to add as part of the activation.
- **Lock Mode To Open** - Specifies what lock mode used to open the lock as part of the activation process. If multiple modes of a lock are being activated at the same time, one of those modes must be used to open the lock after activation. In the case of using FLM or Route mode to open the lock, the user or users to open the lock must be dispatched and given a combination. In the case of using Bank mode to open the lock, the user or users must be one added as part of activating Bank mode.

The specified lock mode to open must be one of the modes being activated for each lock serial number being activated.

- **User 1 ID To Dispatch** - Specifies what first user ID to dispatch to open the lock as part of the activation process. This is needed only if FLM or Route mode is specified to open the lock. It is not required if Bank mode was specified to open the lock for the activation process. This user ID will be dispatched for each lock serial number being activated. The user ID must be the same lock mode as the lock mode specified to open.
- **User 2 ID To Dispatch** - Specifies what second user ID to dispatch to open the lock as part of the activation process. If none of the lock modes to open being activated are specified to be dual access, then this second user ID is not needed. This is needed only if FLM or Route mode is specified to open the lock. It is not required if Bank mode was specified to open the lock for the activation process. This user ID will be dispatched for each lock serial number being activated that require dual access for the lock mode to open. The user ID must be the same lock mode as the lock mode specified to open.
- **IP Address and Port** - Specifies the keybox to connect to from CenTran to initialize the key.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Note

The Cencon Gen 2 lock supports daylight savings time changes through the use of a time offset transition table. This table contains up to 40 entries, which is sufficient for 20 years of operation with two transitions a year. This table is initialized for each lock mode when the lock mode is activated. It is also updated when the time is updated on the lock.

The daylight savings time transition table for the Cencon Gen 2 lock is generated from the selected time zone, using daylight saving time information from the host computer. If the time zone ID is not specified when activating a lock, then the currently set time zone on the host computer is used.

The following is a table of available time zone IDs for the Windows operating system using English. Other language installations may make use of different language time zone IDs.

Windows Time Zone IDs:

UTC Offset	Time Zone ID
-12:00:00	Dateline Standard Time
-11:00:00	UTC-11
-10:00:00	Hawaiian Standard Time
-09:00:00	Alaskan Standard Time

Transaction information returned:

Success:

- Input Transaction Record
- Result Record (result, error code and description): This contains an overall result for the entire transaction.
- Key Serial Number Information
- Array of Lock Record With Result: A lock record and result record for the activation of that lock record. The results of user(s) being dispatched to lock modes for the activation process are contained in the matching lock records.

Failure:

- Input Transaction Record
- Result Record (result, error code and description): This contains an overall result for the entire transaction. Some possible error codes that indicate errors with individual lock modes are:
 - RC_ERR_ACTIVATE_LOCK_DATA_CORRUPT
 - RC_ERR_ACTIVATE_LOCKS_ALL_PROCESSED_NONE_ACTIVATED
 - RC_ERR_ACTIVATE_LOCKS_SOME_NOT_ACTIVATED
- Key Serial Number Information (if any)
- Array of Lock Record With Result: A lock record and result record for the activation of that lock record. This array may or may not be returned depending on the nature of the error. If the error(s) is with individual lock modes, the error information for each lock mode will be returned with the associated result record.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication

Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

Example 1 - Success

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock SA key for activating multiple locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.

3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example initializes a lock SA key for activating a single FLM mode lock though a remote keybox agent persistent network connection identified by **KeyBoxSerialNumber:01E164991400008B**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/init_sa_key_activate
```

Example Input Transaction (HTTP Post) - JSON:

```

3.2.28 Web Service Lock Transactions - Read Lock SA Key for Activating Multiple Locks

CenTran Programming Reference Manual

This transaction is used to read the lock SA key for activating multiple locks in the specified Cencon keybox. It returns the lock activation records from the lock SA key and current matching lock records from the Cencon database.

Transaction information required:

- **IP Address and Port** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- Abbreviated Kaba Mas Company ID - This ID is used to identify the company that initialized the activate key.
- Abbreviated Kaba Mas Device ID - This ID is used to identify the Cencon USB Key Box that initialized the activate key.
- An array of daylight savings time transition table entries/li>
- An array of lock activation records read from the lock SA key, along with the matching lock record from the Cencon database.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock SA key for activating locks.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Additional description of returned lock SA key data:

Kaba Mas Abbreviated Company ID:

This value allows identification of what company activated a lock mode for loss prevention. Each set of company security information for the Cencon USB Key Box includes a unique numeric value to identify the company. This value is also copied to the lock when a lock mode is activated. The company can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

Kaba Mas Abbreviated Device ID:

This value allows identification of what company Cencon USB Key Box activated a lock mode for loss prevention. Each set of company Cencon USB Key Box security information includes a unique numeric value to identify which Cencon USB Key Box was used to initialize the lock SA key for activating the lock. This value is copied to the lock when a lock mode is activated. The company Cencon USB Key Box can be determined by contacting Kaba Mas customer support. If the Cencon lock model is a Cencon Gen 1 lock, this additional security information will not be available.

Daylight Savings Time Transition Record Table Data:

- **Transition Time** - This is the date / time of the daylight savings time transition, in UTC based time. The oldest (earliest) transition time that is prior to the current time is used.
- **Time Zone Bias** - This is the offset in minutes for the local time zone. This offset will be applied to UTC based time to determine the current local time.

Lock Activate Record Data:

- **Serial Number** - This is the serial number for the lock involved in the activate / shelf event.
- **Lock Mode** - This is an identifier for the lock mode involved in the activate / shelf event. This will be F, R, B.
- **If Dual Mode** - This flag indicates if the lock mode requires dual access to open. This will be true if two users are required to open the lock. This will be false if only a single user is required to open the lock.
- **If Gen2 Lock** - This flag indicates if the lock mode is for a Cencon Gen 2 activation or an older Cencon Gen 1 lock. This will be true if for a Cencon Gen 2 lock. This will be false if for a Cencon Gen 1 lock.
- **If Processed By Lock** - This flag indicates if the lock activation record was processed by a lock. This will be true if the key has been used to activate a lock. This will be false if the key has not been used to activate a lock.
- **Customer Number** - This is the generated customer number for the activation of the lock mode. This will be a random six digit numeric value.
- **Bank Open Delay** - The bank open delay only applies to bank mode of the lock. This is the number of minutes (from 1 to 99) that a user will have to wait, after entering a combination and inserting the Personal Identifier Key before the lock will open. If no Time Delay to Open is desired, set this field to 0. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Open Window** - The bank open window only applies to bank mode of the lock. The second part of activating with Time Delay is the Window to Open. This specifies the amount of time, in minutes (from 1 to 99), in which a user must re-insert their key to open the lock after the Time Delay has expired. If the lock is not opened before the Window to Open elapses, the lock resets and the combination(s) and key(s) must be repeated, the time delay elapsed and then the lock opened. It is an optional field, and will default to 0 (no delay) if not set. The Bank Open Delay and Bank Open Window values must be either both zero or both non-zero.
- **Bank Branch ID** - The bank branch ID only applies to bank mode of the lock. If you are activating the bank mode of a lock, then this field will contain the numeric bank branch ID used for the activation of the lock. This numeric bank branch ID is identified in the Cencon database by a unique Bank Name. Any bank mode users that are going to be assigned to the

bank mode lock must be associated with the same Bank Branch.

- **Initialization Date** - This is the UTC based date / time that the lock mode was initialized.
- **Lock Record** - This is the matching Cencon database lock record for the lock mode being activated. If the lock mode is being used to open the lock as part of the lock activation process, the lock record will include the dispatched combination information for the matching lock users to open the lock. For a detailed description of the lock record data, refer to the documentation for [Section 2.2.5 Read Lock Data](#).
- **Lock Key Activate Bank User Record** - This record type will occur multiple times for the activation of a bank mode lock. There will be one bank user record for each user being assigned to the bank mode lock. This record type will contain the following fields:
 - **BankUserID** - This is the numeric bank user ID for the user from the lock SA key. See below for valid ranges for this value for different Cencon generations. Cencon Gen 2 locks supports a greater range of bank user IDs than Cencon Gen 1 locks.
 - **CanType** - This is the can type of the key for the user being added to the bank mode lock. This is a single byte value indicating the hardware model of the key. See below for possible values.
 - **KeyID** - This is the 6 byte key ID for the user being added to the bank mode lock. The combination of the key ID and the can type is a unique value.
 - **IsRequiredChangeCombo** - This flag indicates that the user is required to change their combination at the lock before being permitted to open the lock. This flag is not supported by the Cencon Gen 1 lock. It is supported by the Cencon Gen 2 lock.
 - **IsUserEntryClearedByLock** - This flag indicates that the use entry has been read and cleared by the activation process at a Cencon Gen 1 lock. When a Cencon Gen 1 lock processes a bank mode activation, it clears each user entry to indicate that the user entry has been processed. A Cencon Gen 2 lock does not clear the user entries on a lock SA key for activation.
 - **UserRecord** - This field contains the current matching user record from the Cencon database. For a detailed description of the user record data, refer to the documentation for [Section 2.4.2 Read User Data](#).

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Note

Cencon bank mode limitations differ between Cencon Gen 1 locks and Cencon Gen 2 locks. The following table summarizes the differences between the lock versions:

Feature	Cencon Gen 1	Cencon Gen 2
Number of Users On Lock	1-32	1-100
Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647
Initial Combinations	Bank mode user keys always have an initial default combination of 50-25-50 .	Bank mode user keys have an initial combination as set by the Cencon software.
Combination Valid To Open Lock	Must change bank mode user key initial combination before opening the lock.	Requirement to change the bank mode user key initial combination before opening the lock is set per bank mode user by the Cencon software.
Feature	DS1427 Bank Key	DS1963S Bank Key
Cencon Gen 1	Supported	Not Supported
Cencon Gen 2	Supported	Supported
Security	Legacy Cencon Security	Enhanced Security and Hardware Authentication

Bank Mode User ID Limit Per Bank Branch	1-79	0-2147483647
Bank Branch ID Limit	1-9999	1-2147483647

Example 1 - Success reading lock SA key for activating multiple locks.

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock SA key for audit download transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning

0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example reads a lock SA key for activating multiple locks though a remote keybox agent persistent network connection identified by Cencon Keybox serial number: **01E164991400008B**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/read_sa_key_activate
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/read_sa_key_activate
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "abbreviatedCompanyIDField" : "0063" ,
  "abbreviatedDeviceIDField" : "0182" ,
  "daylightSavingsTimeTransitionRecordField" :

3.2.29 Web Service Lock Transactions - Initialize Lock Dispatch State Resynchronization Key

CenTran Programming Reference Manual

This transaction is used to initialize a lock dispatch state resynchronization key in the specified Cencon keybox. This is to resynchronize the state of a Cencon Gen 2 lock in the Cencon database with the actual state of a Cencon Gen 2 lock. The initialized key is taken to the lock to read the current lock dispatch state, and then returned to save the state to the Cencon database.

The lock mode can not be dispatched while this procedure is in process. After initializing a lock dispatch state resynchronization key for a lock mode, the lock mode must either be resynchronized with the returned key or the rechronization must be cancelled.

Transaction information required:

- Either Lock Name or Lock Serial Number - Specifies the lock to have dispatching resynchronized.
- Lock Mode - Specifies the lock mode to have dispatching resynchronized. This must be either FLM or Route mode. Bank mode is not applicable since it has fixed combinations for user keys.
- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description), the key serial number information, and the lock record for the lock mode being resynchronized.

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04

Example 1 - Initialize Lock Dispatch State Resynchronization Key By Lock Serial Number

This example initializes a lock dispatch state resynchronization key in a keybox hosted by a Cencon Keybox Agent on a network, using a persistent network connection ID for the keybox.

The lock is specified by serial number **1000116** and FLM mode.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/init_resync_key
```

Example Input Transaction: (HTTP Post)

https://kml-3242.domain.local/CentranService/rest/lock/init_resync_key

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_INIT_LOCK_RESYNC_KEY>
  <SerialNumber>1000116</SerialNumber>
  <LockMode>F</LockMode>
  <IPAddress/>
  <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
  <CommunicationsMethod>TcpClient</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_INIT_LOCK_RESYNC_KEY>
```

Example Output Transaction:

```
<RESPONSE_INIT_LOCK_RESYNC_KEY>
  <TRANSACTION_INIT_LOCK_RESYNC_KEY>
    <SerialNumber>1000116</SerialNumber>
    <LockMode>F</LockMode>

Example 2 - Initialize Lock Dispatch State Resynchronization Key By Lock Name

This example initializes a lock dispatch state resynchronization key in a keybox hosted by a Cencon Keybox Agent on a network, using a direct network connection IP address.

The lock is specified by lock name **Gen2Swingbolt 1000116** and FLM mode.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/init_resync_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/init_resync_key
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_INIT_LOCK_RESYNC_KEY>
```

```
<LockName>Gen2Swingbolt 1000116</LockName>
<LockMode>F</LockMode>
<IPAddress>10.108.6.94:53003</IPAddress>
<CommunicationsID/>
<CommunicationsMethod>Tcp</CommunicationsMethod>
<DispatcherID/>
</TRANSACTION_INIT_LOCK_RESYNC_KEY>
```

Example Output Transaction:

```
<RESPONSE_INIT_LOCK_RESYNC_KEY>
  <TRANSACTION_INIT_LOCK_RESYNC_KEY>
    <LockName>Gen2Swingbolt 1000116</LockName>
    <LockMode>F</LockMode>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock resynchronization key transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example

This example initializes a lock resynchronization key through a remote keybox agent network connection:

10.108.6.94:53003

The lock being resynchronized is identified by lock serial number and mode.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/init_resync_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/init_resync_key
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.30 Web Service Lock Transactions - Read Lock Dispatch State Resynchronization Key

CenTran Programming Reference Manual

This transaction is used to read information for reporting purposes from a lock dispatch state resynchronization key.

Transaction information required:

- **IP Address and Port** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- If key was used at lock: Lock Last Open Date
- If key was used at lock: First User To Last Open Lock
- If key was used at lock and lock requires dual access: Second User To Last Open Lock
- Matching Lock Record From Cencon Database

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock resynchronization key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02
202021	SA	Supervisor Audit	Data Transfer	Gen1 & Gen2	Red	teardrop (bent)	DS1996	0x0C
202202	IS	Install Cencon 5 Software	Data Transfer	Cencon 5 & above only	Orange	hourglass (flat)	DS1963S	0x18
202226	CS	Clock Set	Data Transfer	Gen2 + Cencon 5 only	White	hourglass (flat)	DS1922L	0x41
202224	RS	Re-Sync	Data Transfer	Gen2 + Cencon 5 only	Dark Grey	hourglass (flat)	DS1963S	0x18
202220	F	FLM mode personnel	Lock User	Gen2 + Cencon 5 only	Blue	hourglass (flat)	DS1963S	0x18
202222	R	Route mode personnel	Lock User	Gen2 + Cencon 5 only	Yellow	hourglass (flat)	DS1963S	0x18
202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example - Success (Key Not Used At Lock)

The lock resynchronization key was not used at the lock yet.

The remote keybox was connected to using a direct IP address.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/read_resync_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/read_resync_key
```

Example Input Transaction: (HTTP Body)

```

<TRANSACTION_READ_LOCK_RESYNC_KEY>

```

Example - Success (Key Was Used At Lock)

The lock resynchronization key was used at the lock successfully. The lock was last opened by a single user (single user mode).

The remote keybox was connected to using a communications ID for a persistent network connection from the Cencon Keybox Agent service.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/read_resync_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/read_resync_key
```

Example Input Transaction: (HTTP Body)

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock SA key for audit download transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

The lock resynchronization key was used at the lock successfully. The lock was last opened by a single user (single user mode).

The remote keybox was connected to using a communications ID for a persistent network connection from the Cencon Keybox Agent service.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/read_resync_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/read_resync_key
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
```

```

    "iPasswordField" : null
}

```

Example Output Transaction - JSON:

3.2.31 Web Service Lock Transactions - Resynchronize Lock Dispatch State With Key

CenTran Programming Reference Manual

This transaction is used to resynchronize the dispatch state stored for a lock in the Cencon database, using security data read from a lock resynchronization key that had been used at the lock.

Transaction information required:

- **IP Address and Port** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number information
- Original lock record from before the resynchronization operation.
- Result lock record from after the resynchronization operation.

OriginalLockRecord / ResultLockRecord:

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock resynchronization key.
- No key is present in the keybox reader slot.
- Not authorized due to authorization role.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field

name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran resynchronize lock with key transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example reads the key to resynchronize the matching lock through a remote keybox agent persistent network connection identified by Cencon Keybox serial number: **01E164991400008B**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/resync_with_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/resync_with_key
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iPAddressField" : null
}
```

Example Output Transaction - JSON:

```
{
  "keyInformationField" :
  {
    "canTypeField" :
    [
      24
    ] ,
    "keyIDField" :

3.2.32 Web Service Lock Transactions - Cancel Lock Dispatch State Resynchronization

CenTran Programming Reference Manual

This transaction cancels the process of resynchronizing a Cencon database entry for a lock mode with a Cencon Gen 2 Lock dispatch state. This transaction can be used if the resynchronization key to be used at the lock was lost or the lock was found not to be out of sync.

After canceling the resynchronization of the lock, the lock is restored to its normal dispatch state. A new resynchronization key can be made or the lock can be dispatched as normal.

Transaction information required:

- Lock Name or Serial Number - The name or serial number of the lock to cancel resynchronization.
- Lock Mode - The mode of the lock to cancel resynchronization.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the lock record.

Refer to the documentation for [Section 2.2.5 Read Lock Data](#) for details on the lock record data returned.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Lock doesn't exist.
- Lock mode is not in process of being resynchronized.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

Example - Success - Cancel Resynchronization By Lock Name

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/cancel_resync
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/cancel_resync
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_CANCEL_LOCK_RESYNC>
  <LockName>Gen2Swingbolt 1000116</LockName>
  <LockMode>F</LockMode>
  <DispatcherID/>
</TRANSACTION_CANCEL_LOCK_RESYNC>
```

Example Output Transaction:

```
<RESPONSE_CANCEL_LOCK_RESYNC>
  <TRANSACTION_CANCEL_LOCK_RESYNC>
    <LockName>Gen2Swingbolt 1000116</LockName>
    <LockMode>F</LockMode>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CANCEL_LOCK_RESYNC>
  <ResultRecord>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field

name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran Cancel Lock Dispatch State Resynchronization transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

Example Using JSON - Success - Cancel Resynchronization By Lock Name

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/cancel_resync
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/cancel_resync
```

Example Input Transaction (HTTP Body) - JSON:

```

3.2.33 Web Service Lock Transactions - Initialize Lock Time Set Key

CenTran Programming Reference Manual

This transaction is used to initialize a lock time set key in the specified Cencon keybox. A white hour glass shaped key, iButton model DS1922, is required.

Transaction information required:

- Time Zone ID (Optional)- Unique Identifier for the time zone to use for generating the daylight savings time table to be written to the key.

The lock time set key sets the time at the lock and also updates the daylight savings time transition table on the lock. This daylight savings time transition table is generated based on the specified time zone. If a time zone is not specified, then the CenTran server time zone is used.

The lock time set key contains a table of 40 entries sufficient for 20 years of daylight savings times transitions. Each lock mode of the Cencon lock uses this table to convert from the lock clock in UTC (Coordinated Universal Time) to the current local time.

- IP Address and Port - Specifies the keybox to connect to from CenTran to initialize the key.
- Communications ID - Specifies an alternate identification of a keybox to connect to from CenTran to initialize the key. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- Communications Method - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the key serial number information.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Incorrect model of key is present in the keybox reader slot.
- No key is present in the keybox reader slot.
- Invalid time zone specified.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04

Example - Success without specified time zone, using Cencon Keybox IP address:

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/init_time_set_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/init_time_set_key
```

Example Input Transaction: (HTTP Body)

```

<TRANSACTION_INIT_LOCK_TIME_SET_KEY>
  <IPAddress>10.108.6.94:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_INIT_LOCK_TIME_SET_KEY>

```

Example Output Transaction:

```

<RESPONSE_INIT_LOCK_TIME_SET_KEY>
  <TRANSACTION_INIT_LOCK_TIME_SET_KEY>
    <IPAddress>10.108.6.94:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_INIT_LOCK_TIME_SET_KEY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Initialize lock time set key succeeded.</Description>
  </ResultRecord>
  <KeyInformation>
    <KeyID>00000000CCCA1</KeyID>
    <CanType>41</CanType>
  </KeyInformation>
</RESPONSE_INIT_LOCK_TIME_SET_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran initialize lock time set key transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the IPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example initializes a lock time set key using Vladivostok Standard Time through a remote keybox agent persistent connection: **KeyBoxSerialNumber:01E164991400008B**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/init_time_set_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/init_time_set_key
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
}
```

```

    "dispatcherIDField" : null ,
    "iPAddressField" : null ,
    "timeZoneIDField" : "Vladivostok Standard Time"
}

```

Example Output Transaction - JSON:

```

{
  "keyInformationField" :
  {
    "canTypeField" :
    [
      65
    ] ,
    "keyIDField" :
    [
      0 ,
      0 ,
      0 ,
      12 ,
      204 ,
      161
    ]
  } ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Initialize lock time set key succeeded."
    ] ,

    "iPAddressField" : null ,
    "timeZoneIDField" : "Vladivostok Standard Time"
  }
}

```

3.2.34 Web Service Lock Transactions - Read Time Set Key

CenTran Programming Reference Manual

This transaction is used to read the lock time set key in the specified Cencon keybox. It returns the time set key clock time, server time for comparison, time time zone ID written to the key, and the daylight savings time transition table on the key.

Transaction information required:

- **IP Address and Port** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Input transaction
- Result record indicating success
- Key serial number and model information
- Time set key clock time (UTC)
- Server time for comparison (UTC)
- Measured time drift of the key from server time (Seconds)
- IfKeyClockIsEnabled flag indicating if the key clock is running correctly.
- Key time zone ID. Up to 64 character string in ASCII. The string stored on the key does not support internationalization.
- Array of up to 40 entries of daylight savings time transition records for the lock conversion to local time.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- The key in the keybox reader slot is not a lock time set key.
- No key is present in the keybox reader slot.
- The data on the key has been corrupted.

Daylight Savings Time Transition Record:

- **TransitionTime** - Specifies the time that transition takes affect for calculating local time from the lock clock UTC. The daylight savings time transition is used if the current lock clock UTC time is equal to or greater than the transition time, and the lock clock UTC time is less than the next entry transition time in the table.
- **TimeZoneBias** - Specifies an integer bias from UTC time in minutes for the local time zone daylight savings time, in minutes. This integer value can be positive or negative.

Note

Key Model Descriptions:

Kaba Part	Abbreviation	Description	Category	Compatibility	Color	Shape	Model	Can Type
202020	F	FLM mode personnel	Lock User	Gen1 & Gen2	Blue	teardrop (bent)	DS1994	0x04
202022	R	Route mode personnel	Lock User	Gen1 & Gen2	Yellow	teardrop (bent)	DS1994	0x04
202023	B	Bank mode personnel	Lock User	Gen1 & Gen2	Green (Teal)	teardrop (bent)	DS1427	0x84
202024	L	Logon to Cencon (Ex: D, S, SS)	Software User	all Cencon S/W versions	Black	teardrop (bent)	DS1991	0x02

202223	B	Bank mode personnel	Lock User	Gen2 + Cencon 5 only	Green	hourglass (flat)	DS1963S	0x18

Example - Success. Key is read using persistent network connection ID for keybox.

This example is reading a lock time set key initialized for the Vladivostok Standard Time zone, which has a fixed daylight savings time bias.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/read_time_set_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/read_time_set_key
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_READ_LOCK_TIME_SET_KEY>
  <IPAddress/>
  <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
  <CommunicationsMethod>TcpClient</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_READ_LOCK_TIME_SET_KEY>
```

Example Output Transaction:

```
<RESPONSE_READ_LOCK_TIME_SET_KEY>
  <TRANSACTION_READ_LOCK_TIME_SET_KEY>
    <IPAddress/>
    <CommunicationsID>KeyBoxSerialNumber:01E164991400008B</CommunicationsID>
    <CommunicationsMethod>TcpClient</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_LOCK_TIME_SET_KEY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Read of lock time set key succeeded.</Description>
  </ResultRecord>
  <KeyInformation>
    <KeyID>0000000CCCA1</KeyID>
    <CanType>41</CanType>
  </KeyInformation>
  <KeyDateTimeUTC>2015-04-21T15:14:52Z</KeyDateTimeUTC>
  <ServerDateTimeUTC>2015-04-21T15:14:55.081Z</ServerDateTimeUTC>
  <KeyTimeDriftSeconds>-3</KeyTimeDriftSeconds>
  <IfKeyClockIsEnabled>true</IfKeyClockIsEnabled>
  <KeyTimeZoneID>Vladivostok Standard Time</KeyTimeZoneID>
  <DaylightSavingsTimeTransitionRecord>
    <TransitionTime>2000-01-01T00:00:00Z</TransitionTime>
    <TimeZoneBias>600</TimeZoneBias>
  </DaylightSavingsTimeTransitionRecord>
</RESPONSE_READ_LOCK_TIME_SET_KEY>
```

Example - Success. The key is read using a direct network connection by IP address 10.108.6.94:53003 for the keybox.

This example is reading a lock time set key initialized for the China Standard Time zone, which has a fixed daylight savings time bias.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/lock/read_time_set_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/lock/read_time_set_key
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_READ_LOCK_TIME_SET_KEY>

</DaylightSavingsTimeTransitionRecord>
</RESPONSE_READ_LOCK_TIME_SET_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read lock time set key transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the iPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example reads a lock time set key through a remote keybox agent persistent network connection identified by Cencon Keybox serial number: **01E164991400008B**

The lock time set key is initialized for Eastern Standard Time zone, which has an annual change in daylight savings time bias.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/lock/read_time_set_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/lock/read_time_set_key
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "communicationsIDField" : "KeyBoxSerialNumber:01E164991400008B" ,
  "communicationsMethodField" : 1 ,
  "dispatcherIDField" : null ,
  "iPAddressField" : null
}

```

Example Output Transaction - JSON:

```

3.3.1 Web Service Route Transactions - Add a Route

CenTran Programming Reference Manual

This transaction adds a route to the database. If the route exists, its data can be overwritten if the allow overwrite flag is set in the input transaction file.

Transaction information required:

- Route Name
- Customer ID (A valid Customer ID is either empty or a value corresponding to one of the Customer IDs in the customer table)
- Region (If region control is enabled, region has to be non-empty and should correspond to one of the entries in the region table. If region control is not enabled, region can be empty but any non-empty value should correspond to one of the entries in the region table.)
- If Allow Overwrite (Optional) - Flag to allow overwrite of existing route. All details except route 'Creation Date' are overwritten.
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Route name is empty
- Customer ID not found
- Region not found
- Region control is enabled but region is empty

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/add
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ADD_ROUTE>
  <RouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionD</Region>
  </RouteRecord>
  <!-- bool -->
  <IfAllowOverwrite>false</IfAllowOverwrite>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ADD_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_ROUTE) and a result record (indicating success).

```
<RESPONSE_ADD_ROUTE>
  <TRANSACTION_ADD_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionD</Region>
    </RouteRecord>
    <IfAllowOverwrite>false</IfAllowOverwrite>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route CentranRoute successfully added to the database.
  </Description>
  </ResultRecord>
</RESPONSE_ADD_ROUTE>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

https://{host}/CentranService/rest/route/add

Example Input Transaction (HTTP Post):

https://kml-3242.domain.local/CentranService/rest/route/add

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ADD_ROUTE>
  <RouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>NoRegion</Region>
  </RouteRecord>
  <!-- bool -->
  <IfAllowOverwrite>true</IfAllowOverwrite>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ADD_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_ROUTE), a result record indicating failure with an error code (RC_ERR_REGION_DOESNT_EXIST) and description.

```
<RESPONSE_ADD_ROUTE>
  <TRANSACTION_ADD_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>NoRegion</Region>
    </RouteRecord>
    <IfAllowOverwrite>true</IfAllowOverwrite>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ADD_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_REGION_DOESNT_EXIST</ErrorCode>
    <Description>Region NoRegion does not exist in the region table.</Description>
  </ResultRecord>
</RESPONSE_ADD_ROUTE>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add route transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example adds a route named **TestRoute8**.

Input Transaction Format (HTTP Post) - JSON:

https://{host}/CentranServiceJSON/rest/route/add

Example Input Transaction (HTTP Post) - JSON:

https://kml-3242.domain.local/CentranServiceJSON/rest/route/add

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "ifAllowOverwriteField" : false ,
  "ifAllowOverwriteFieldSpecified" : false ,
```

```

"routeRecordField" :
{
    "creationDateField" : null ,
    "creationDateFieldSpecified" : false ,
    "customerIDField" : "North Bank" ,
    "regionField" : "KENTUCKY" ,
    "routeNameField" : "TestRoute8"
}
}

```

Example Output Transaction - JSON:

```

{
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "Route TestRoute8 successfully added to the database."
        ] ,
        "errorCodeField" : "RC_OK" ,
        "ifRetryValidField" : false ,
        "resultField" : 0
    } ,
    "routeRecordField" : null ,
    "tTRANSACTION_ADD_ROUTEField" :
    {
        "dispatcherIDField" : "CentranSS" ,
        "ifAllowOverwriteField" : false ,
        "ifAllowOverwriteFieldSpecified" : false ,
        "routeRecordField" :
        {
            "creationDateField" : null ,
            "creationDateFieldSpecified" : false ,
            "customerIDField" : "North Bank" ,
            "regionField" : "KENTUCKY" ,
            "routeNameField" : "TestRoute8"
        }
    }
}

```

3.3.2 Web Service Route Transactions - Read a Route

CenTran Programming Reference Manual

This transaction reads a route and all the locks on the route from the database.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, a result record (result, error code and description), the complete route record and all route lock records on the route.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route does not exist.
- Dispatcher not authorized to do this operation.
- Not authorized due to region (region control active).
- Route lock table can't be opened.

Example 1 - Success

Input Transaction Format:

```
https://{host}/CentranService/rest/route/{routename}/data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/route/TestRte5/data
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_ROUTE), a result record (indicating success), the complete route record and all the route lock records found on the route. If no route lock records are found, a comment is placed after the route record indicating that no locks have been found on the route.

```
<RESPONSE_READ_ROUTE>
  <TRANSACTION_READ_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte5</RouteName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route TestRte5 found and read from the route table.
  </Description>
  </ResultRecord>
  <RouteRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <RouteName>TestRte5</RouteName>
    <CreationDate>2004-12-25T15:49:18</CreationDate>
    <CustomerID>ACustomer</CustomerID>
    <Region />
  </RouteRecord>
  <!--The following locks have been found on the route:-->
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>VLK015</LockName>
    <User1ID>rzjane</User1ID>
    <User2ID>rzjohn</User2ID>
    <RouteName>TestRte5</RouteName>
    <OpenDate>2004-12-22T15:49:18</OpenDate>
    <CloseDate>2004-12-25T15:49:18</CloseDate>
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RESPONSE_READ_ROUTE>
```

Example 2 - Failure

Input Transaction Format:

```
https://{host}/CentranService/rest/route/{routename}/data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/route/CentranRoute/data
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_ROUTE), a result record indicating failure with an error code (RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION) and description. In this case, the dispatcher belongs to a local (as against global) region different from the route's region.

```
<RESPONSE_READ_ROUTE>
  <TRANSACTION_READ_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>CentranRoute</RouteName>
    <DispatcherID>SuperUserLocalRegion</DispatcherID>
  </TRANSACTION_READ_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_REGION</ErrorCode>
    <Description>Dispatcher belongs to a local region. The dispatcher's region does not match the route's region.
  </Description>
  </ResultRecord>
</RESPONSE_READ_ROUTE>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read route transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

In this example, **TestRoute8** is read.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/{routename}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/TestRoute8/data
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {

3.3.3 Web Service Route Transactions - Update a Route

CenTran Programming Reference Manual

This transaction updates data for an existing route in the database. The route fields to be updated have to be specified in the input transaction. Those route fields that are not specified in the input transaction are not changed from their current values.

Transaction information required:

- Route Name
- Customer ID (Optional) – The new value for this field
- Region (Optional) – The new value for this field
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, a result record (result, error code and description) and the updated route record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Invalid Customer ID (Customer ID not found in database).
- Invalid Region (Region not found in database)
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.
- Input transaction file has validation errors against the schema or the required input fields have an empty or invalid value.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/update
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/update
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_UPDATE_ROUTE>
  <UpdateRouteRecord>
    <CustomerID>North Bank</CustomerID>
    <RouteName>TestRoute4</RouteName>
  </UpdateRouteRecord>
  <DispatcherID></DispatcherID>
</TRANSACTION_UPDATE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_ROUTE), a result record (indicating success) and the updated route record with new Customer ID and Region values.

```
<RESPONSE_UPDATE_ROUTE>
  <TRANSACTION_UPDATE_ROUTE>
    <UpdateRouteRecord>
      <CustomerID>North Bank</CustomerID>
      <RouteName>TestRoute4</RouteName>
    </UpdateRouteRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Route TestRoute4 has been updated successfully.</Description>
  </ResultRecord>
  <RouteRecord>
    <RouteName>TestRoute4</RouteName>
    <CustomerID>North Bank</CustomerID>
    <Region>KENTUCKY</Region>
    <CreationDate>2011-07-18T14:51:05.777Z</CreationDate>
  </RouteRecord>
</RESPONSE_UPDATE_ROUTE>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/update
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/update
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_UPDATE_ROUTE>
  <UpdateRouteRecord>
    <!-- char string -->
    <RouteName>CentranRoute</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionC</Region>
  </UpdateRouteRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_UPDATE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_UPDATE_ROUTE), a result record indicating failure with an error code (RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_NEW_REGION) and description. Here, the dispatcher's region is local (in scope as opposed to global) and different from that of the new region for the route. An update route transaction would also fail if the dispatcher's region is local and different from the route's current region.

```
<RESPONSE_UPDATE_ROUTE>
  <TRANSACTION_UPDATE_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <UpdateRouteRecord>
      <RouteName>CentranRoute</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionC</Region>
    </UpdateRouteRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_UPDATE_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_MATCH_ROUTE_NEW_REGION</ErrorCode>
    <Description>Dispatcher belongs to a local region.
    The dispatcher's region does not match the route's new region.
    </Description>
  </ResultRecord>
</RESPONSE_UPDATE_ROUTE>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran update route transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example updates the **TestRoute4** route.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/update
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "updateRouteRecordField" :
  {
    "customerIDField" : "North Bank" ,
    "regionField" : null ,
    "routeNameField" : "TestRoute4"
  }
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Route TestRoute4 has been updated successfully."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "routeRecordField" :
  {
    "creationDateField" : "\Date(1311000665777)\/" ,
    "creationDateFieldSpecified" : true ,
    "customerIDField" : "North Bank" ,
    "regionField" : "KENTUCKY" ,
    "routeNameField" : "TestRoute4"
  } ,
  "tTRANSACTION_UPDATE_ROUTEField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "updateRouteRecordField" :
    {
      "customerIDField" : "North Bank" ,
      "regionField" : null ,
      "routeNameField" : "TestRoute4"
    }
  }
}
```

3.3.4 Web Service Route Transactions - Delete a Route

CenTran Programming Reference Manual

This transaction deletes a route from the database. It also deletes the route lock entries for this route from the route lock table.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description).

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Failed to delete from route table.
- Not authorized due to region (region control active).
- Dispatcher not authorized to do this operation.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/delete
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/delete
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DELETE_ROUTE>
  <!-- char string -->
  <RouteName>CentranRoute</RouteName>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_DELETE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_ROUTE), a result record (indicating success).

```
<RESPONSE_DELETE_ROUTE>
  <TRANSACTION_DELETE_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>CentranRoute</RouteName>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_ROUTE>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route CentranRoute has been deleted successfully.</Description>
  </ResultRecord>
</RESPONSE_DELETE_ROUTE>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/delete
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/delete
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DELETE_ROUTE>
  <!-- char string -->
  <RouteName>123456</RouteName>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_DELETE_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_ROUTE), a result record indicating failure with an error code (RC_ERR_ROUTE_NOT_FOUND) and description.

```
<RESPONSE_DELETE_ROUTE>
  <TRANSACTION_DELETE_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>123456</RouteName>
```

```

    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DELETE_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ROUTE_NOT_FOUND</ErrorCode>
    <Description>Failed to find route 123456 in the route table.
  </Description>
  </ResultRecord>
</RESPONSE_DELETE_ROUTE>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete route transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example deletes the **TestRoute1** route.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/delete
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "dispatcherIDField" : null ,
  "routeNameField" : "TestRoute1"
}

```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Route TestRoute1 has been deleted successfully."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_DELETE_ROUTEField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "routeNameField" : "TestRoute1"
  }
}

```

3.3.5 Web Service Route Transactions - Add Locks to a Route

CenTran Programming Reference Manual

This transaction adds locks to an existing route in the database. The locks to be added are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Array of Lock Records to be added to the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of route locks with a result record for each lock.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks were added successfully). In this case the error code for the transaction would be RC_OK.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of result records (one result record for each lock) with those route lock records that were added successfully to the database.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (some locks were added successfully and the others failed) or if the transaction is a complete failure (none of the locks were added to the route). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in case of complete failure the error code for the transaction would be RC_NOT_OK.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route doesn't exist.
- Locks don't exist.
- Locks invalid (not in Active or Install mode).
- Dispatcher and route belong to different regions.
- Not authorized due to authorization role.
- Route and lock belong to different regions

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ADD_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK016</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK015</LockName>
  <LockSequence>2</LockSequence>
</RouteLockRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_ADD_LOCKS_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating success) followed by result records for each lock. The locks that were added to the route lock table have their route lock records retrieved from the table and appended to the end of their result records. The output transaction has one or more RouteLockRecordWithResult parent elements, which is an output unit for each lock record specified in the input file. The unit contains a result record followed by the retrieved route lock record.

```
<RESPONSE_ADD_LOCKS_ROUTE>
  <TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte4</RouteName>
    <RouteLockRecord>
      <LockName>VLK016</LockName>
      <LockSequence>1</LockSequence>
    </RouteLockRecord>
    <RouteLockRecord>
      <LockName>VLK015</LockName>
      <LockSequence>2</LockSequence>
    </RouteLockRecord>
    <DispatcherID>CentranSS</DispatcherID>
```

```

</TRANSACTION_ADD_LOCKS_ROUTE>
<ResultRecord>
  <Result>Success</Result>
  <ErrorCode>RC_OK</ErrorCode>
  <Description>All specified locks have been added to the route.
</Description>
</ResultRecord>
<RouteLockRecordWithResult>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Lock VLK016, sequence 1 added
    successfully to the route lock table.
    </Description>
  </ResultRecord>
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>VLK016</LockName>
    <User1ID />
    <User2ID />
    <RouteName>TestRte4</RouteName>
    <OpenDate xsi:nil="true" />
    <CloseDate xsi:nil="true" />
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RouteLockRecordWithResult>
<RouteLockRecordWithResult>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Lock VLK015, sequence 2 added successfully to the route lock table.
    </Description>
  </ResultRecord>
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>VLK015</LockName>
    <User1ID />
    <User2ID />
    <RouteName>TestRte4</RouteName>
    <OpenDate xsi:nil="true" />
    <CloseDate xsi:nil="true" />
    <LockSequence>2</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RouteLockRecordWithResult>
</RESPONSE_ADD_LOCKS_ROUTE>

```

Example 2 - Partial Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_ADD_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK014</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK015</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_ADD_LOCKS_ROUTE>

```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating failure with an error code of RC_PARTIAL_OK) for the transaction followed by result records for each lock. Those locks that could be added to the route lock table have their route lock records retrieved from the table and appended to the end of their result records. The output transaction has one or more RouteLockRecordWithResult parent elements, which is an output unit for each lock record specified in the input file. The unit contains a result record followed by the retrieved route lock record (if result is success) and just the result record (if result is failure).

```
<RESPONSE_ADD_LOCKS_ROUTE>
```

```

<TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <RouteName>TestRte4</RouteName>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>

  <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
</RouteLockRecord>
</RouteLockRecordWithResult>
</RESPONSE_ADD_LOCKS_ROUTE>

```

Example 3 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Post):

```
https://kml-3242/CentranService/rest/route/lock-add
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_ADD_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK009</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLKShelved</LockName>
  <LockSequence>1</LockSequence>
</RouteLockRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_ADD_LOCKS_ROUTE>

```

Output Transaction:

The output transaction has the original input transaction (TRANSACTION_ADD_LOCKS_ROUTE), a result record (indicating failure) followed by result records for each lock that could not be added to the route.

```

<RESPONSE_ADD_LOCKS_ROUTE>
  <TRANSACTION_ADD_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte4</RouteName>
    <RouteLockRecord>

      <Description>None of the specified locks could be added to the route.</Description>
    </ResultRecord>
    <RouteLockRecordWithResult>
      <ResultRecord>
        <Result>Failure</Result>
        <ErrorCode>RC_ERR_LOCK_ROUTE_REGION_MISMATCH</ErrorCode>
        <Description>The lock's region does not match the route's region.</Description>
      </ResultRecord>
    </RouteLockRecordWithResult>
    <RouteLockRecordWithResult>
      <ResultRecord>
        <Result>Failure</Result>
        <ErrorCode>RC_ERR_INVALID_LOCK_REC_RECTYPE</ErrorCode>
        <Description>Lock VLKShelved is neither in Active mode nor in Install mode.
      </Description>
      </ResultRecord>
    </RouteLockRecordWithResult>
  </RESPONSE_ADD_LOCKS_ROUTE>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add route transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 4 - JSON

This example adds locks **VLK010**, **VLK012**, and **VLK013** to the route **TestRoute8** on route sequences 1, 2, and 3.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/lock-add
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/lock-add
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "dispatcherIDField" : null ,
  "routeLockRecordField" :
  [
    {
      "closeDateField" : null ,
      "closeDateFieldSpecified" : false ,

3.3.6 Web Service Route Transactions - Read Locks on a Route

CenTran Programming Reference Manual

This transaction reads data for locks on a route either from the database or from a route file. If successful, the output would include both the route lock record and the corresponding lock record for each lock on the route.

Transaction information required:

- Route Name
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information (route lock, lock records) would be retrieved if the transaction failed due to reasons like lack of authorization or invalid route name. If the pre-requisites like authorization, valid route name are satisfied, the route information retrieved for each lock on the route has a route lock record (if found in database or route file), lock record (if found in database) and result record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (only some of the locks were read successfully) or if the transaction is a complete failure (none of the locks were read successfully). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in case of complete failure the error code for the transaction would be RC_NOT_OK. A lock may not be read successfully if, for example the route lock exists but the matching lock record does not.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Route does not exist.
- Invalid route name.
- All locks on route don't exist.
- Dispatcher and route belong to different regions (route belongs to a database).
- Not authorized due to authorization role.
- Validation error.

Example 1 - Success

Input Transaction Format:

```
https://{host}/CentranService/rest/route/{routename}/lock-data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/route/TestRte4/lock-data
```

Example Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCKS_ROUTE), a result record (indicating success) followed by data for each lock on the route. The output unit for each lock found on the route is LockRecordAndRouteLockRecord which consists of a result record, lock record and route lock record.

```

Example 2 - Failure

Input Transaction Format:

```
https://{host}/CentranService/rest/route/{routename}/lock-data
```

Example Input Transaction:

```
https://kml-3242.domain.local/CentranService/rest/route/TestRte7/lock-data
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_READ_LOCKS_ROUTE), a result record (indicating failure) followed by data for each lock on the route. The output unit for each lock found on the route is LockRecordAndRouteLockRecord which consists of a result record, lock record and route lock record. In this case, the route lock record specified in the route file has no matching lock record. So, the result record indicates a failure and only the route lock information retrieved from the route file is displayed.

```

</RESPONSE_READ_LOCKS_ROUTE>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This field is used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read locks on route transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning

0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

In this example, lock data for **TestRoute8** is read.

Lock **VLK010** is present on the route for sequences 1, 2, and 3. Route sequences 1 and 2 are dispatched. Lock **VLK010** is dual mode.

Lock **VLK012** is present on the route for sequences 1, 2, and 3. Route sequences 1 and 2 are dispatched. Lock **VLK012** is single mode.

Lock **VLK013** is present on the route for sequences 1, 2, and 3. Route sequence 1 is dispatched. Lock **VLK013** is single mode.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/{routename}/lock-data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/TestRoute8/lock-data
```

Example Output Transaction - JSON:

3.3.7 Web Service Route Transactions - Delete Locks from a Route

CenTran Programming Reference Manual

This transaction deletes locks from an existing route in the database. The locks to be deleted are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Array of Lock Records to be deleted from the route:
 - Lock name
 - Lock sequence
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of route locks (retrieved prior to deletion) with a result record for each lock.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks were deleted successfully from the route). In this case the error code for the transaction would be RC_OK.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and an array of data for each lock on the route - result record, route lock record (retrieved prior to deletion).

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a partial success (some locks were deleted successfully and the others failed) or if the transaction is a complete failure (none of the locks were deleted from the route). In the case of partial success, the error code for the transaction would be RC_PARTIAL_OK and in the case of complete failure, the error code for the transaction would be RC_NOT_OK.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks on route being deleted are open on the route.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.
- Route lock does not exist.

Example

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-delete
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-delete
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DELETE_LOCKS_ROUTE>
  <!-- char string -->
  <RouteName>TestRte4</RouteName>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName></LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK011</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- route lock record -->
  <RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_DELETE_LOCKS_ROUTE>
```

Output Transaction:

Note: The output transaction has the original input transaction (TRANSACTION_DELETE_LOCKS_ROUTE), a result record (indicating success) followed by result records for each lock. The locks that were found in the route lock table have their route lock records retrieved from the table (prior to deletion) and appended to the end of their result records. In this case, one lock has an invalid name, lock VLK011 was not found, lock VLK014 was open on the route (its route lock record was found and retrieved), and lock VLK015 was deleted successfully (its route lock record was found and retrieved prior to deletion). The error code for the transaction is RC_PARTIAL_OK (because one lock could be deleted successfully from the route) but the overall result is deemed a Failure.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran delete locks from route transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example removes lock **VLK018** route sequence 1 and lock **VLK020** route sequence 1 from route **TestRoute2**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/lock-delete
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/lock-delete
```

Example Input Transaction (HTTP Body) - JSON:

```

```

3.3.8 Web Service Route Transactions - Dispatch All Locks on a Route

CenTran Programming Reference Manual

This transaction dispatches all locks on an existing route in the database or from a route file.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Flag to indicate if lock errors allowed (conditional dispatch).
- Dispatcher ID (Optional) – If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were dispatched successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were dispatched successfully, and some locks failed).

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name or failure of any other condition that needs to be satisfied before attempting to dispatch a lock on a route. If an attempt was made to dispatch the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure'.

NOTE: The output transaction may have one or more 'LockRecordAndRouteLockRecord' elements. Each element is an output unit for each lock that was either successfully dispatched or failed to be dispatched. The unit contains a result record followed by a lock record (if found in the database) and a route lock record (if found in the database).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks already open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/dispatch-all
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/dispatch-all
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <RouteName>TestRte3</RouteName>
  <User1ID>rzjack</User1ID>
  <User2ID>rzjill</User2ID>
  <IfAllowLockErrors>0</IfAllowLockErrors>
  <DispatcherID/>
</TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>
```

Output Transaction:

Here, the route in the database has no locks assigned to it and so no locks are dispatched.

```
<RESPONSE_DISPATCH_ALL_LOCKS_ROUTE>
  <TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteName>TestRte3</RouteName>
    <User1ID>rzjack</User1ID>
    <User2ID>rzjill</User2ID>
    <IfAllowLockErrors>0</IfAllowLockErrors>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_ROUTE_NO_LOCKS_ASSIGNED</ErrorCode>
    <Description>The route has no locks assigned to it.</Description>
  </ResultRecord>
</RESPONSE_DISPATCH_ALL_LOCKS_ROUTE>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/dispatch-all
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/dispatch-all
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <RouteName>TestRte4</RouteName>
  <UserID>rzjill</UserID>
  <User2ID>rzjack</User2ID>
  <IfAllowLockErrors>0</IfAllowLockErrors>
  <DispatcherID/>
</TRANSACTION_DISPATCH_ALL_LOCKS_ROUTE>
```

Output Transaction:

NOTE: If no lock errors are allowed, no locks on the route will be dispatched even if one of them causes a group mismatch, region mismatch, does not exist, is already open or is not in active mode. In this case, one lock on the route is already open and so none of the locks are dispatched. Only the details (result record, lock record and route lock record) of the open lock VLK014 are displayed.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route dispatch all locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.

4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 4 - JSON

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/dispatch-all
```

Example Input Transaction (HTTP Post) - JSON:

3.3.9 Web Service Route Transactions - Dispatch Locks on a Route

CenTran Programming Reference Manual

This transaction dispatches some of the locks on an existing route in the database or from a route file. The locks to be dispatched are specified as route lock records (as defined in the schema) in the input transaction file.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Array of Lock Records to be dispatched on the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) – If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were dispatched successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were dispatched successfully, and some locks failed).

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name or failure of any other condition that needs to be satisfied before attempting to dispatch a lock on a route. If an attempt was made to dispatch the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure'.

NOTE: The output transaction may have one or more 'LockRecordAndRouteLockRecord' elements. Each element is an output unit for each lock that was either successfully dispatched or failed to be dispatched. The unit contains a result record followed by a lock record (if found in the database) and a route lock record (if found in the database).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks already open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/dispatch
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/dispatch
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <RouteName>TestRte4</RouteName>
  <User1ID>fjrb1</User1ID>
  <User2ID>fjrb2</User2ID>
  <IfAllowLockErrors>0</IfAllowLockErrors>
  <RouteLockRecord>
    <LockName>VLK016</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <DispatcherID/>
</TRANSACTION_DISPATCH_LOCKS_ROUTE>
```

Output Transaction:

In this case, users fjrb1 and fjrb2 are FLM users and CentranSS is a Special Supervisor. So, none of the locks are dispatched and the error code for the whole transaction is RC_ERR_FLMBOTH_NOT_SAME_MODE_AS_LOCK. Each route lock has its own error code.

```

</RESPONSE_DISPATCH_LOCKS_ROUTE>

```

Example 2 - Partial Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/dispatch
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/dispatch
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_DISPATCH_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK013</LockName>
  <LockSequence>1</LockSequence>
  <UserID>rjrb1</UserID>
</RouteLockRecord>
<!-- route lock record -->
<RouteLockRecord>
  <LockName>VLK014</LockName>
  <LockSequence>1</LockSequence>
  <UserID>rzjill</UserID>
</RouteLockRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_DISPATCH_LOCKS_ROUTE>
```

Output Transaction:

In this example, lock VLK013 does not exist. Therefore an appropriate error code is displayed in the result record. Since no route lock record or lock record for VLK013 exists, only the result record is displayed. Lock VLK014 is dispatched successfully. The error code for the whole transaction is RC_PARTIAL_OK indicating partial success or partial failure, depending on whether you think of the glass as half full or half empty...

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route dispatch locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 4 - JSON

This example dispatches lock **VLK010** on route sequence 1 and 2, lock **VLK012** on route sequence 1 and 2, and lock **VLK013** on route sequence 1. The locks are dispatched on route **TestRoute8** to users **rbob** and **rdave**. Lock **VLK010** is dual mode. locks **VLK012** and **VLK013** are single mode.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/dispatch
```

Example Input Transaction (HTTP Post) - JSON:

3.3.10 Web Service Route Transactions - Reassign All Locks On a Route

CenTran Programming Reference Manual

This transaction reassigns all locks on an existing route in the database.

Transaction information required:

- Route Name
- Route User ID 1
- Route User ID 2
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were reassigned successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole.

Each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' if the transaction is a partial success (some locks were reassigned successfully and the others failed). In the case of partial success, the error code for the transaction would be RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization or failure of any other condition that needs to be satisfied before attempting to reassign the locks on a route.

If an attempt was made to reassign the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were reassigned on the route). In the case of complete failure, the error code for the transaction will vary depending on the error.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist or otherwise invalid.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/reassign-all
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/reassign-all
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte1</RouteName>
<!-- char string -->
<User1ID>rzjill</User1ID>
<!-- char string -->
<User2ID>rzjack</User2ID>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
```

Output Transaction:

In this example, none of the locks are reassigned because the region control is set and the dispatcher's region (local in scope) does not match the route's region.

```
<RESPONSE_REASSIGN_ALL_LOCKS_ROUTE>
<TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <RouteName>TestRte1</RouteName>
  <User1ID>rzjill</User1ID>
  <User2ID>rzjack</User2ID>
  <DispatcherID>SuperUserTestRegionD</DispatcherID>
</TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
<ResultRecord>
```

```

<Result>Failure</Result>
<ErrorCode>RC_ERR_DISPATCHER_REGION_DOES_NOT_
MATCH_ROUTE_REGION</ErrorCode>
<Description>Dispatcher belongs to a local region. The dispatcher's
region does not match the route's region.
</Description>
</ResultRecord>
</RESPONSE_REASSIGN_ALL_LOCKS_ROUTE>

```

Example 2 - Partial Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/reassign-all
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/reassign-all
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>
<!-- char string -->
<RouteName>TestRte4</RouteName>
<!-- char string -->
<User1ID>rzjack</User1ID>
<!-- char string -->
<User2ID>rzjill</User2ID>
<!-- char string -->
<DispatcherID>
</TRANSACTION_REASSIGN_ALL_LOCKS_ROUTE>

```

Output Transaction:

In this example, lock VLK014 was reassigned successfully but lock VLK016 wasn't because it was not open. The error code for the whole transaction is 'RC_PARTIAL_OK RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED' which indicates that the transaction partially succeeded and that some locks on the route were not reassigned.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route reassign all locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

In this example, all locks on route **TestRte6** are reassigned to lock user **rdave**. All of the locks on the route are in single mode to open.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/reassign-all
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/reassign-all
```

Example Input Transaction (HTTP Body) - JSON:

```
{
    "dispatcherIDField" : null ,
    "routeNameField" : "TestRte6" ,
    "user1IDField" : "rdave" ,
    "user2IDField" : ""
}
```

Example Output Transaction - JSON:

```
{

3.3.11 Web Service Route Transactions - Reassign Locks On a Route

CenTran Programming Reference Manual

This transaction reassigns some locks on an existing route in the database. The locks to be reassigned are specified as route lock records (as defined in the schema) in the input transaction file. This transaction will work even if the route specified in the input transaction does not exist (because it has been deleted after dispatch). The route is determined by what locks are specified in the transaction.

Transaction information required:

- Route User ID 1
- Route User ID 2
- Array of Lock Records to be reassigned on the route:
 - Lock Name
 - Lock Sequence
- Dispatcher ID (Optional) - If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all locks on the route were reassigned successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole.

Each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' if the transaction is a partial success (some locks were reassigned successfully and the others failed). In the case of partial success, the error code for the transaction would be RC_ERR_REASSIGN_ROUTE_SOME_NOT_REASSIGNED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization or failure of any other condition that needs to be satisfied before attempting to reassign the locks on a route.

If an attempt was made to reassign the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. The only exception to this rule is when an invalid lock name, invalid User ID or invalid lock sequence is specified as input for a route lock record and in this case only the result record is displayed for that particular route lock record.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were reassigned on the route). In the case of complete failure, the error code for the transaction will vary depending on the error.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Users don't exist, or otherwise invalid.
- Route doesn't exist or otherwise invalid.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/reassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/reassign
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_REASSIGN_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <User1ID>rzjill</User1ID>
  <User2ID>rzjack</User2ID>
  <RouteLockRecord>
    <LockName>VLKNoLock</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <DispatcherID/>
</TRANSACTION_REASSIGN_LOCKS_ROUTE>
```

Output Transaction:

In this example, route TestRte6 does not exist because it has been deleted after lock VLK016 was dispatched on it. The transaction nevertheless succeeds and the details of lock VLK016 are displayed after reassignment.

```
<RESPONSE REASSIGN LOCKS ROUTE>

</RESPONSE_REASSIGN_LOCKS_ROUTE>

```

Example 2 - Partial Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/reassign
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/reassign
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_REASSIGN_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <User1ID>rzjill</User1ID>
  <User2ID>rzjack</User2ID>
  <RouteLockRecord>
    <LockName>VLKNoLock</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <RouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
  </RouteLockRecord>
  <DispatcherID/>
</TRANSACTION_REASSIGN_LOCKS_ROUTE>

```

Output Transaction:

In this example, locks VLK014 and VLK015 are reassigned successfully, but lock VLKNoLock is not found. The transaction is returned as a partial success.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route reassign locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

In this example, lock **VLK009** on route **TestRte6** is reassigned to lock user **rdave** for route sequence 1 and 2.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/reassign
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/reassign
```

Example Input Transaction (HTTP Body) - JSON:

```

3.3.12 Web Service Route Transactions - Close Locks on a Route

CenTran Programming Reference Manual

This transaction closes the specified locks on an existing route in the database. This transaction will work even if the route specified in the input transaction does not exist because it has been deleted after dispatch.

Transaction information required:

- Array of Lock Records to be closed on the route:
 - Lock Name
 - Lock Sequence
 - Close Seal
 - Force Close Flag
- Dispatcher ID (Optional) – If this field is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'Success' only if the transaction is a complete success (all the locks were closed successfully). In this case the error code for the transaction would be RC_OK.

PartialSuccess:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole and for each lock on the route - a route lock record, lock record and result record.

NOTE: The result record for the whole transaction has as its result 'PartialSuccess' only if the transaction is a partial success (some locks on the route were closed successfully, and some locks failed). In this case the error code for the transaction would be RC_RC_ERR_CLOSE_ROUTE_NOT_ALL_CLOSED.

Failure:

Input transaction, followed by a result record (result, error code and description) for the transaction as a whole. No route information is displayed if the transaction failed due to reasons like lack of authorization, invalid route name, or failure of any other condition that needs to be satisfied before attempting to close a lock on the route.

If an attempt was made to close the locks, for each lock on the route - a route lock record (if found), lock record (if found) and result record is displayed. There are two exceptions to this rule -

a) If an invalid lock name, invalid lock sequence is specified in the input route lock record: In this case, only the result record is displayed.

b) If one of the locks on the route is to be force closed but is not a skipped route sequence: In this case, that particular lock's details (result record, lock record and route lock record) alone are displayed.

NOTE: The result record for the whole transaction has as its result 'Failure' if the transaction is a complete failure (none of the locks were closed). The error code for the transaction will vary depending on the reason for the failure.

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Locks not open, or otherwise invalid.
- Locks don't exist.
- Close seal invalid.
- Number of close attempts exceeded.
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/close
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/close
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_CLOSE_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <CloseRouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>2</LockSequence>
    <CloseSeal>01</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <CloseRouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>1</LockSequence>
    <CloseSeal>0</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <CloseRouteLockRecord>
    <LockName></LockName>
    <LockSequence>1</LockSequence>
    <CloseSeal>0</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <DispatcherID/>
</TRANSACTION_CLOSE_LOCKS_ROUTE>
```

Output Transaction:

In this example, an attempt is made to close a lock with an incorrect close seal, close a lock that is not open, and close a lock with a blank name. The output consists of the details (result record, lock record, route lock record) of each lock.

```

Example 2 - PartialSuccess

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/close
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/close
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_CLOSE_LOCKS_ROUTE xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
  <CloseRouteLockRecord>
    <LockName>VLK015</LockName>
    <LockSequence>1</LockSequence>
    <CloseSeal>72</CloseSeal>
    <IfForcedClosed>1</IfForcedClosed>
  </CloseRouteLockRecord>
  <CloseRouteLockRecord>
    <LockName>VLK014</LockName>
    <LockSequence>2</LockSequence>
    <CloseSeal>0</CloseSeal>
    <IfForcedClosed>0</IfForcedClosed>
  </CloseRouteLockRecord>
  <DispatcherID/>
</TRANSACTION_CLOSE_LOCKS_ROUTE>

```

Output Transaction:

In this example, the first lock has the correct close seal and is closed successfully. The second lock is not open, so it fails.

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route close locks transaction:

lockModeField - Lock Mode Enumeration:

Value	Enumerated Value	Meaning
0	F	FLM Mode
1	R	Route Mode
2	B	Bank Mode

recordTypeField - Lock Status Type Enumeration:

Value	Enumerated Value	Meaning
0	D	Lock is shelved.
1	A	Lock is active.
2	P	Lock is pending being shelved.
3	I	Lock is inactive, activated but never used.
4	R	Lock is being replaced.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 4 - JSON

This example closes lock **VLK010** on route sequence 1 and 2. The lock is dispatched on route **TestRoute8** to users **rbob** and **rdave**. Lock **VLK010** is dual user to open.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/close
```

Example Input Transaction (HTTP Post) - JSON:

https://kml-3242.domain.local/CentranServiceJSON/rest/route/close

Example Input Transaction (HTTP Body) - JSON:

```
{
  "closeRouteLockRecordField" :
  [
    {
      "closeSealField" : "51" ,
      "ifForcedClosedField" : false ,
      "lockNameField" : "VLK010" ,
      "lockSequenceField" : "1"
    } ,
    {
      "closeSealField" : "13" ,
      "ifForcedClosedField" : false ,
      "lockNameField" : "VLK010" ,
      "lockSequenceField" : "2"
    }
  ] ,
  "dispatcherIDField" : null
}
```

Example Output Transaction - JSON:

```

3.3.13 Web Service Route Transactions - Route Table Query

CenTran Programming Reference Manual

This transaction queries the route table for a set of route records. The Input transaction file contains a query record which in turn contains a set of route fields to create a query from. The route query does not have a 'like search' option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the route records in the route table are retrieved.

- Route Name
- Creation Date range (Creation Date Start and Creation Date End)
- Customer ID
- Region Name
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: Since the route query does not have a "search like" option, all search field values (except Creation Date range fields) must completely match the values of the fields in the database. If the record for route name TestRoute needs to be searched and retrieved, the value of the route name search field has to be TestRoute and not Test or Route or any other substring of TestRoute.

Note: If the Dispatcher belongs to a local region and region control is enabled, only those routes belonging to that particular region and also satisfying the search condition are retrieved. The search condition's region field value is automatically set to the dispatcher's local region even if a different value has already been provided in the query record.

Note: For the Creation Date Range search, both the lower and upper bounds for the search have to be specified i.e. both Creation Date Start and Creation Date End have to be specified. If only Creation Date Start is specified in the query record, that search field will not have any effect on the result.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the route records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error – failed to open route table.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_QUERY>
  <RouteQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <CustomerID>ACustomer</CustomerID>
    <!-- char string -->
    <Region>TestRegionA</Region>
    <!-- date -->
    <CreationDateStart>2004-12-21T00:00:01</CreationDateStart>
    <!-- date -->
    <CreationDateEnd>2005-01-21T00:00:01</CreationDateEnd>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ROUTE_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY>
  <TRANSACTION_ROUTE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteQueryRecord>
      <RouteName>TestRte1</RouteName>
      <CustomerID>ACustomer</CustomerID>
      <Region>TestRegionA</Region>
      <CreationDateStart>2004-12-21T00:00:01</CreationDateStart>
      <CreationDateEnd>2005-01-21T00:00:01</CreationDateEnd>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route record/s found satisfying the search condition.
    </Description>
  </ResultRecord>
```

```
<RouteRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <RouteName>TestRte1</RouteName>
  <CreationDate>2004-12-22T15:49:18</CreationDate>
  <CustomerID>ACustomer</CustomerID>
  <Region>TestRegionA</Region>
</RouteRecord>
</RESPONSE_ROUTE_QUERY>
```

Example 2 - Failure

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_QUERY>
<RouteQueryRecord>
  <!-- char string -->
  <RouteName>Test</RouteName>
</RouteQueryRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_ROUTE_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY>
  <TRANSACTION_ROUTE_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteQueryRecord>
      <RouteName>Test</RouteName>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>No route record found satisfying the search condition.
    </Description>
  </ResultRecord>
</RESPONSE_ROUTE_QUERY>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example - JSON

This example queries the route table for routes assigned to the customer ID **North Bank**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/query
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "routeQueryRecordField" :
  {
    "creationDateEndField" : null ,
    "creationDateEndFieldSpecified" : false ,
    "creationDateStartField" : null ,
    "creationDateStartFieldSpecified" : false ,
    "customerIDField" : "North Bank" ,
    "regionField" : null ,
    "routeNameField" : null
  }
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of route records matching the given query: 8."
    ] ,

```

3.3.14 Web Service Route Transactions - Route Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the route table matching the given query condition. It operates in the same manner as the Route Table Query transaction.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_QUERY_COUNT>
  <RouteQueryRecord>
    <!-- char string -->
    <Region>TestRegionA</Region>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ROUTE_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ROUTE_QUERY_COUNT>
  <TRANSACTION_ROUTE_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteQueryRecord>
      <Region>TestRegionA</Region>
    </RouteQueryRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route records matching the given query: 2.</Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ROUTE_QUERY_COUNT>
```

Example 2 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_QUERY_COUNT>
  <RouteQueryRecord>
    <!-- char string -->
    <Region>TestRegionA</Region>
  </RouteQueryRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ROUTE_QUERY_COUNT>
```

Output Transaction:

In this example, SuperUserTestRegionD belongs to a local region TestRegionD and therefore replaces TestRegionA as the search field for the query. Only one route in TestRegionD is found.

```
<RESPONSE_ROUTE_QUERY_COUNT>
  <TRANSACTION_ROUTE_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteQueryRecord>
      <Region>TestRegionA</Region>
    </RouteQueryRecord>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ROUTE_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route records matching the given query: 1.
  </Description>
  </ResultRecord>
  <QueryCount>1</QueryCount>
</RESPONSE_ROUTE_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route query count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the route table for a count of routes created after 1 JAN 2014.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "routeQueryRecordField" :
  {
    "creationDateEndField" : null ,
    "creationDateEndFieldSpecified" : false ,
    "creationDateStartField" : "\/Date(1388552400000-0500)\/" ,
    "creationDateStartFieldSpecified" : true ,
    "customerIDField" : null ,
    "regionField" : null ,
    "routeNameField" : null
  }
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "2" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of route records matching the given query: 2."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_ROUTE_QUERY_COUNTField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "routeQueryRecordField" :
    {
      "creationDateEndField" : null ,
      "creationDateEndFieldSpecified" : false ,
      "creationDateStartField" : "\/Date(1388552400000-0500)\/" ,
      "creationDateStartFieldSpecified" : true ,
      "customerIDField" : null ,
      "regionField" : null ,
      "routeNameField" : null
    }
  }
}
```

3.3.15 Web Service Route Transactions - Route Lock Table Query

CenTran Programming Reference Manual

This transaction queries the route lock table for a set of route lock records. The Input transaction file contains a query record which in turn contains a set of route lock fields to create a query from. The route lock query does not have a "search like" option.

Transaction information required:

All the fields listed below are optional. If no fields are present in the query record, then all the route lock records in the route lock table are retrieved.

- Lock Name
- Route Name
- Lock Sequence
- User ID (searches for this User ID in both the FLM1ID and FLM2ID route lock record fields)
- Open Time Date range (Open Date Start and Open Date End)
- Close Time Date range (Close Date Start and Close Date End)
- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.

Note: Since the route lock query does not have a 'like search' option, all search field values (except the Date range fields) must completely match the values of the fields in the database.

Note: If the Dispatcher belongs to a local region and region control is enabled, the search goes through 2 phases. In the first phase, only those route locks satisfying the search condition are retrieved. In the second phase, the region of each retrieved route lock's route is compared against the dispatcher's region and only those that match are displayed by CenTran.

Note: For the Open Date Range search and Close Date Range search, both the lower and upper bounds of the range have to be specified. If only the lower bound (Date Start) or if only the upper bound (Date End) is specified, that search field will be ignored.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and all the route lock records matching the given search query. If no records are returned by the search query, the result of the transaction is still deemed a success.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- Dispatcher not authorized to do this operation.
- Database error - failed to open route table.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-query
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_LOCK_QUERY>
  <RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <LockName>VLK020</LockName>
    <!-- char string -->
    <LockSequence>1</LockSequence>
    <!-- char string -->
    <UserID>rzjohn</UserID>
    <!-- date -->
    <OpenDateStart>2004-12-21T00:00:01</OpenDateStart>
    <!-- date -->
    <OpenDateEnd>2004-12-23T00:00:01</OpenDateEnd>
    <!-- date -->
    <CloseDateStart>2004-12-24T00:00:01</CloseDateStart>
    <!-- date -->
    <CloseDateEnd>2004-12-26T00:00:01</CloseDateEnd>
  </RouteLockQueryRecord>
  <!-- char string -->
  <DispatcherID/>
</TRANSACTION_ROUTE_LOCK_QUERY>
```

Output Transaction:

```
<RESPONSE_ROUTE_LOCK_QUERY>
  <TRANSACTION_ROUTE_LOCK_QUERY xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteLockQueryRecord>
      <RouteName>TestRte1</RouteName>
      <LockName>VLK020</LockName>
      <LockSequence>1</LockSequence>
      <UserID>rzjohn</UserID>
      <OpenDateStart>2004-12-21T00:00:01</OpenDateStart>
      <OpenDateEnd>2004-12-23T00:00:01</OpenDateEnd>
      <CloseDateStart>2004-12-24T00:00:01</CloseDateStart>
      <CloseDateEnd>2004-12-26T00:00:01</CloseDateEnd>
    </RouteLockQueryRecord>
```

```

    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_ROUTE_LOCK_QUERY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Route lock record/s found satisfying the search condition.
  </Description>
  </ResultRecord>
  <RouteLockRecord xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <LockName>VLK020</LockName>
    <User1ID>rzjane</User1ID>
    <User2ID>rzjohn</User2ID>
    <RouteName>TestRte1</RouteName>
    <OpenDate>2004-12-22T15:49:18</OpenDate>
    <CloseDate>2004-12-25T15:49:18</CloseDate>
    <LockSequence>1</LockSequence>
    <DispatchOrder>0</DispatchOrder>
    <ResultCode>0</ResultCode>
    <IfCloseSealDuress>0</IfCloseSealDuress>
    <IfCloseSealLowBattery>0</IfCloseSealLowBattery>
  </RouteLockRecord>
</RESPONSE_ROUTE_LOCK_QUERY>

```

Example 2 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-query
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-query
```

Example Input Transaction (HTTP Body):

```

<TRANSACTION_ROUTE_LOCK_QUERY>
<!-- route lock query record -->
<RouteLockQueryRecord>
</RouteLockQueryRecord>
<!-- char string -->
<DispatcherID/>
</TRANSACTION_ROUTE_LOCK_QUERY>

```

Output Transaction:

In this case there are no search fields specified in the route lock query record but the dispatcher belongs to a local region 'TestRegionD'. Therefore, all the locks on routes which belong to TestRegionD are displayed. Here, only those locks on route TestRte4 are retrieved because only TestRte4 belongs to TestRegionD.

```

<RESPONSE_ROUTE_LOCK_QUERY>

</RESPONSE_ROUTE_LOCK_QUERY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a **+** indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route lock query transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example queries the route lock table for locks assigned to route **TestRoute8** that were closed after **8 SEP 2014**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/lock-query
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/lock-query
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "routeLockQueryRecordField" :
  {
    "closeDateEndField" : null ,
    "closeDateEndFieldSpecified" : false ,
    "closeDateStartField" : "\\Date(1410148800000-0400)\\/" ,
    "closeDateStartFieldSpecified" : true ,
    "lockNameField" : null ,

        "openDateStartField" : null ,
        "openDateStartFieldSpecified" : false ,
        "routeNameField" : "TestRoute8" ,
        "userIDField" : null
    }
}
}

```

3.3.16 Web Service Route Transactions - Route Lock Table Query Record Count

CenTran Programming Reference Manual

This transaction returns the number of records in the route lock table matching the given query condition. It operates in the same manner as the Route Lock Table Query transaction.

Example 1 - Success

Input Transaction Format (HTTP Post):

```
https://{host}/CentranService/rest/route/lock-query-count
```

Example Input Transaction (HTTP Post):

```
https://kml-3242.domain.local/CentranService/rest/route/lock-query-count
```

Example Input Transaction (HTTP Body):

```
<TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
  <!-- route lock query record -->
  <RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <LockName>VLK018</LockName>
  </RouteLockQueryRecord>
  <!-- char string -->
  <DispatcherID>
</TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
```

Output Transaction:

```
<RESPONSE_ROUTE_LOCK_QUERY_COUNT>
  <TRANSACTION_ROUTE_LOCK_QUERY_COUNT xmlns="http://www.kaba-mas.com/CentranTransac.xsd">
    <RouteLockQueryRecord></RouteLockQueryRecord>
    <!-- char string -->
    <RouteName>TestRte1</RouteName>
    <!-- char string -->
    <LockName>VLK018</LockName>
    <DispatcherID>SuperUserTestRegionD</DispatcherID>
  </TRANSACTION_ROUTE_LOCK_QUERY_COUNT>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>Number of route lock records matching the given query: 2.
  </Description>
  </ResultRecord>
  <QueryCount>2</QueryCount>
</RESPONSE_ROUTE_LOCK_QUERY_COUNT>
```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran route lock query count transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 2 - JSON

This example queries the route lock table for a count of locks on route **TestRoute8**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/route/lock-query-count
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/route/lock-query-count
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "routeLockQueryRecordField" :
  {
    "closeDateEndField" : null ,
    "closeDateEndFieldSpecified" : false ,
    "closeDateStartField" : null ,
    "closeDateStartFieldSpecified" : false ,
    "lockNameField" : null ,
    "lockSequenceField" : null ,
    "openDateEndField" : null ,
    "openDateEndFieldSpecified" : false ,
    "openDateStartField" : null ,
    "openDateStartFieldSpecified" : false ,
    "routeNameField" : "TestRoute8" ,
    "userIDField" : null
  }
}
```

Example Output Transaction - JSON:

```
{
  "queryCountField" : "9" ,
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "Number of route lock records matching the given query: 9."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_ROUTE_LOCK_QUERY_COUNTField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "routeLockQueryRecordField" :
    {
      "closeDateEndField" : null ,
      "closeDateEndFieldSpecified" : false ,
      "closeDateStartField" : null ,
      "closeDateStartFieldSpecified" : false ,
      "lockNameField" : null ,
      "lockSequenceField" : null ,
      "openDateEndField" : null ,
      "openDateEndFieldSpecified" : false ,
      "openDateStartField" : null ,
      "openDateStartFieldSpecified" : false ,
      "routeNameField" : "TestRoute8" ,
      "userIDField" : null
    }
  }
}
```

3.4.1 Web Service User Transactions - Change User Name

CenTran Programming Reference Manual

This transaction is used to change a user name, based off of the original name and a given new name.

This transaction renames a user. It is the equivalent of the 'Rename User' operation from a user report in Cencon. It adds a record into the user history table for the old user name. It updates records in the lock log table if the user is a route or flm lock key, and is currently dispatched to a lock. It also updates the route lock table if the user is currently dispatched on a route.

Transaction information required:

- Old User ID
- New User ID

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example 1 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/change_name
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/change_name
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_CHANGE_USER_NAME>
  <OldUserID>rzjill</OldUserID>
  <NewUserID>rzjane</NewUserID>
  <DispatcherID/>
</TRANSACTION_CHANGE_USER_NAME>
```

Example Output Transaction:

```
<RESPONSE_CHANGE_USER_NAME>
  <TRANSACTION_CHANGE_USER_NAME>
    <OldUserID>rzjill</OldUserID>
    <NewUserID>rzjane</NewUserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CHANGE_USER_NAME>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_RENAME_USER_ID_NEW_USER_ID_ALREADY_EXISTS</ErrorCode>
    <Description>Error in renaming user rzjill. Failed to rename user. The new user ID
already exists. A user can not be renamed to an already existing user ID.</Description>
  </ResultRecord>
</RESPONSE_CHANGE_USER_NAME>
```

Example 2 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/change_name
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/change_name
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_CHANGE_USER_NAME>
  <OldUserID>rzjill</OldUserID>
  <NewUserID>rzgail</NewUserID>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_CHANGE_USER_NAME>
```

Output Transaction:

```

<RESPONSE_CHANGE_USER_NAME>
  <TRANSACTION_CHANGE_USER_NAME>
    <OldUserID>rzjill</OldUserID>
    <NewUserID>rzgail</NewUserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_CHANGE_USER_NAME>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <Description>User rzjill has been successfully changed to rzgail.
  </Description>
  </ResultRecord>
</RESPONSE_CHANGE_USER_NAME>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran change user name transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/change_name
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/change_name
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "dispatcherIDField" : null ,
  "newUserIDField" : "Dave - Route" ,
  "oldUserIDField" : "F12"
}

```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "The user rename succeeded."
    ] ,
    "errorCodeField" : "RC_OK" ,
    "ifRetryValidField" : false ,
    "resultField" : 0
  } ,
  "tTRANSACTION_CHANGE_USER_NAMEField" :
  {
    "dispatcherIDField" : "CentranSS" ,
    "newUserIDField" : "Dave - Route" ,
    "oldUserIDField" : "F12"
  }
}

```

3.4.2 Web Service User Transactions - Read User By Name

CenTran Programming Reference Manual

This transaction is used to read data for a user from the Cencon database based on the user name.

Transaction information required:

- User ID - Uniquely identifies a user record.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the retrieved user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/user-ids/{USERID}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/user-ids/F12/data
```

Example Output Transaction:

```
<RESPONSE_READ_USER>
  <TRANSACTION_READ_USER>
    <UserID>F12</UserID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_USER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>The user was successfully read from the database.</Description>
  </ResultRecord>
  <UserRecord>
    <UserID>F12</UserID>
    <SecurityLevel>2</SecurityLevel>
    <KeyID>0000006D5632</KeyID>
    <CanType>04</CanType>
    <NumberCombosIssued>10</NumberCombosIssued>
    <CreationDate/>
    <DeletionDate/>
    <Nickname>Dave</Nickname>
    <NicknameExpirationDate/>
    <GroupName/>
    <NumberTimeWindows>0</NumberTimeWindows>

<CustomerID>ACustomer</CustomerID>
<UserCombo>0</UserCombo>
<IfMustChangeCombo>false</IfMustChangeCombo>
<IfLegacyImport>false</IfLegacyImport>
</UserRecord>
</RESPONSE_READ_USER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read user by name transaction:

itemElementNameField - Enumeration array of itemsField array field contents:

itemsField is an array containing either user name or array values for key can type and serial number.

Value	Enumerated Value	Meaning
0	CanType	itemField array element contains key can type.
1	KeyID	itemField array element contains 6 byte key ID.
2	UserID	itemField array element contains user name.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

This example reads the user named **Dave - Route** from the user table. Note that spaces are encoded as **%20** in URLs.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/user-ids/{USERID}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user-ids/Dave%20-%20Route/data
```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "The user was successfully read from the database."
    ] ,

3.4.3 Web Service User Transactions - Read User By Key Serial Number

CenTran Programming Reference Manual

This transaction is used to read data for a user from the Cencon database based on the user key serial number (Can Type / Key ID).

Transaction information required:

- User key serial number (Can Type / Key ID) - Uniquely identifies a user record.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

- Result record indicating success
- Lock record data from Cencon database

Failure:

- Result record indicating failure

Example

Input Transaction Format: (HTTP Get)

```
https://{host}/CentranService/rest/user-keyserials/{CANTYPE}/{KEYID}/data
```

Example Input Transaction: (HTTP Get)

```
https://kml-3242.domain.local/CentranService/rest/user-keyserials/04/0000006D5632/data
```

Example Output Transaction:

```
<RESPONSE_READ_USER>
  <TRANSACTION_READ_USER>
    <CanType>04</CanType>
    <KeyID>00000023F0D3</KeyID>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_READ_USER>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>The user was successfully read from the database.</Description>
  </ResultRecord>
  <UserRecord>
    <UserID>F12</UserID>
    <SecurityLevel>2</SecurityLevel>
    <KeyID>0000006D5632</KeyID>
    <CanType>04</CanType>
    <NumberCombosIssued>10</NumberCombosIssued>
    <CreationDate/>
    <DeletionDate/>
    <Nickname>Dave</Nickname>
    <NicknameExpirationDate/>
    <GroupName/>
    <NumberTimeWindows>0</NumberTimeWindows>
    <Window1Start>0</Window1Start>
    <Window1Duration>0</Window1Duration>
    <IfWindow1Sun>false</IfWindow1Sun>
    <IfWindow1Mon>false</IfWindow1Mon>
    <IfWindow1Tue>false</IfWindow1Tue>
    <IfWindow1Wed>false</IfWindow1Wed>
    <IfWindow1Thu>false</IfWindow1Thu>
    <IfWindow1Fri>false</IfWindow1Fri>
    <IfWindow1Sat>false</IfWindow1Sat>
    <Window2Start>0</Window2Start>
    <Window2Duration>0</Window2Duration>
    <IfWindow2Sun>false</IfWindow2Sun>
    <IfWindow2Mon>false</IfWindow2Mon>
    <IfWindow2Tue>false</IfWindow2Tue>
    <IfWindow2Wed>false</IfWindow2Wed>
    <IfWindow2Thu>false</IfWindow2Thu>
    <IfWindow2Fri>false</IfWindow2Fri>
    <IfWindow2Sat>false</IfWindow2Sat>
    <Window3Start>0</Window3Start>
    <Window3Duration>0</Window3Duration>
    <IfWindow3Sun>false</IfWindow3Sun>
    <IfWindow3Mon>false</IfWindow3Mon>
    <IfWindow3Tue>false</IfWindow3Tue>
    <IfWindow3Wed>false</IfWindow3Wed>
    <IfWindow3Thu>false</IfWindow3Thu>
    <IfWindow3Fri>false</IfWindow3Fri>
    <IfWindow3Sat>false</IfWindow3Sat>
```

```

<Region>KENTUCKY</Region>
<ServiceBranch>North Bank Branch 22</ServiceBranch>
<FirstName>David</FirstName>
<MiddleName>K</MiddleName>
<LastName>Rockefeller</LastName>
<LastUsedDate/>
<AuthorizationRole>Route</AuthorizationRole>
<BankUserID>0</BankUserID>
<TotalNumberCombosIssued>0</TotalNumberCombosIssued>
<MaximumNumberAllowedCombos>0</MaximumNumberAllowedCombos>
<EnabledStartDate>2009-04-12T08:00:00Z</EnabledStartDate>
<EnabledEndDate>2013-01-01T08:00:00Z</EnabledEndDate>
<BankBranchName/>
<CustomerID>ACustomer</CustomerID>
<UserCombo>0</UserCombo>
<IfMustChangeCombo>false</IfMustChangeCombo>
<IfLegacyImport>false</IfLegacyImport>
</UserRecord>
</RESPONSE_READ_USER>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran read user by key serial number transaction:

itemElementNameField - Enumeration array of itemsField field array contents:

itemsField is an array containing either user name or array values for key can type and serial number.

Value	Enumerated Value	Meaning
0	CanType	itemField array element contains key can type.
1	KeyID	itemField array element contains 6 byte key ID.
2	UserID	itemField array element contains user name.

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

This example reads the user named **Dave - Route** from the user table. Note that spaces are encoded as **%20** in URLs.

Input Transaction Format (HTTP Get) - JSON:

```
https://{host}/CentranServiceJSON/rest/user-keyserials/{CANTYPE}/{KEYID}/data
```

Example Input Transaction (HTTP Get) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/04/0000006D5632/data
```

Example Output Transaction - JSON:

```

{
  "resultRecordField" :
  {
    "descriptionField" :
    [
      "The user was successfully read from the database."
    ] ,

3.4.4 Web Service User Transactions - Update User Data

CenTran Programming Reference Manual

This transaction is used to update the database information for a user based on the user name or the user key serial number (Can Type / Key ID).

This transaction updates data for a user. The user fields to be updated have to be specified in the input transaction. Those user fields that are not specified in the input transaction are not changed from their current values. Region for a special supervisor will not be updated because a special supervisor should not be assigned to any region.

Transaction information required:

- User ID (uniquely identifies a user record) or Can Type and Key ID (both these fields together uniquely identifies a user record)
- Nickname (Optional) - The new value for this field
- Nickname Expiration Date (Optional) - The new value for this field
- Region (Optional) - The new value for this field
- Service Branch (Optional) - The new value for this field
- First Name (Optional) - The new value for this field
- Middle Name (Optional) - The new value for this field
- Last Name (Optional) - The new value for this field
- Customer ID (Optional) - The new value for this field
- Maximum Number Allowed Combos (Optional) - The new value for this field
- Enabled Start Date (Optional) - The new value for this field
- Enabled End Date (Optional) - The new value for this field

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire updated user record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Invalid Customer ID (Customer ID not found in database).
- Invalid Region (Region not found in database)
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/update
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_USER>
  <UpdateUserRecd>
    <Region>TestReg</Region>
    <Nickname>jill</Nickname>
    <UserID>rzjill</UserID>
  </UpdateUserRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_USER>
```

Output Transaction:

The transaction fails because the new region does not exist in the region table of the database.

```
<RESPONSE_UPDATE_USER>
  <TRANSACTION_UPDATE_USER>
    <UpdateUserRecord>
      <Region>TestReg</Region>
      <Nickname>jill</Nickname>
      <UserID>rzjill</UserID>
    </UpdateUserRecord>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_USER>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_CHANGE_REGION_DOESNT_EXIST</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to update user region. The specified region does not exist:
TestReg</Description>
```

```
</ResultRecord>
</RESPONSE_UPDATE_USER>
```

Example 2 - Success updating user by User ID

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/update
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242/CentranService/rest/user/update
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_USER>
  <UpdateUserRecord>
    <EnabledEndDate>2013-01-01T08:00:00</EnabledEndDate>
    <EnabledStartDate>2009-04-12T08:00:00</EnabledStartDate>
    <CustomerID>ACustomer</CustomerID>
    <LastName>Rockefeller</LastName>
    <MiddleName>K</MiddleName>
    <FirstName>David</FirstName>
    <ServiceBranch>North Bank Branch 22</ServiceBranch>
    <Region>KENTUCKY</Region>
    <NicknameExpirationDate>2012-08-22T04:00:00</NicknameExpirationDate>
    <Nickname>Dave</Nickname>
    <UserID>F12</UserID>
  </UpdateUserRecord>
  <DispatcherID/>
</TRANSACTION_UPDATE_USER>
```

Output Transaction:

The transaction succeeds and the specified user fields are updated with new values.

```
<RESPONSE_UPDATE_USER>
  <TRANSACTION_UPDATE_USER>
    <UpdateUserRecord>
      <EnabledEndDate>2013-01-01T08:00:00</EnabledEndDate>
      <EnabledStartDate>2009-04-12T08:00:00</EnabledStartDate>
      <CustomerID>ACustomer</CustomerID>
      <LastName>Rockefeller</LastName>

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran update user transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example

This example sets the first, middle and last name, as well as the service branch, for user ID **FLM SHA Key 6**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/update
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/update
```

Example Input Transaction (HTTP Body) - JSON:

```

{
  "dispatcherIDField" : null ,
  "updateUserRecordField" :
  {
    "canTypeField" : null ,
    "customerIDField" : null ,
    "enabledEndDateField" : null ,
    "enabledEndDateFieldSpecified" : false ,
    "enabledStartDateField" : null ,
    "enabledStartDateFieldSpecified" : false ,
    "firstNameField" : "Fred" ,
    "keyIDField" : null ,
    "lastNameField" : "Farber" ,
    "maximumNumberAllowedCombosField" : null ,
    "middleNameField" : "Forth" ,
    "nicknameExpirationDateField" : null ,
    "nicknameExpirationDateFieldSpecified" : false ,
    "nicknameField" : null ,

```

```

        "regionField" : null ,
        "serviceBranchField" : "North Bank Branch 6" ,
        "userIDField" : "FLM SHA Key 6"
    }
}

```

Example Output Transaction - JSON:

```

{
    "resultRecordField" :
    {
        "descriptionField" :
        [
            "The user update succeeded."

```

3.4.5 Web Service User Transactions - User Change Bank Mode Default Combination

CenTran Programming Reference Manual

This transaction is used to update the database with a new bank mode default combination for a bank mode user based on the user name.

The new bank mode default combination is set only in the user record in the database. This new value for the user's bank mode default combination is used the next time the user is assigned to a Cencon Gen 2 lock. Existing locks that the user is already assigned to will have the old value, unless the user is deleted from and then assigned back to a lock.

Transaction information required:

- Dispatcher ID - If the ID field value is missing or left blank, the default dispatcher ID specified in CenTran's registry is used.
- User ID (uniquely identifies a user record)
- User Combination - The new bank mode default combination for the user
- If Must Change Combo - Flag indicating if the user must change from the default combination to a new combination before being permitted to open the lock.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the entire updated user record.

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User doesn't exist.
- Invalid Combination
- Not authorized due to region (region control active).
- Not authorized due to authorization role.

Example 1 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/change_bank_mode_combination
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/change_bank_mode_combination
```

Example Input Transaction: (HTTP Body)

```
<TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <UserID>Not A Real User Name</UserID>
  <UserCombo>123456</UserCombo>
  <IfMustChangeCombo>>false</IfMustChangeCombo>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
```

Output Transaction:

The transaction fails because the specified user does not exist.

```
<RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
  <TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
    <UserID>Not A Real User Name</UserID>
    <UserCombo>123456</UserCombo>
    <IfMustChangeCombo>>false</IfMustChangeCombo>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_USER_NOT_FOUND</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>User ID not found in database: Not A Real User Name</Description>
  </ResultRecord>
</RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
```

Example 2 - Success changing user bank mode default combination by User ID

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/change_bank_mode_combination
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/change_bank_mode_combination
```

Input Transaction:

```

<TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <UserID>Bank SHA Key 10004</UserID>
  <UserCombo>123456</UserCombo>
  <IfMustChangeCombo>>false</IfMustChangeCombo>
  <DispatcherID>CentranSS</DispatcherID>
</TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>

```

Output Transaction:

The transaction succeeds and the user bank mode default combination and flag if must change combination to open lock are updated.

```

<RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>
  <TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
    <UserID>Bank SHA Key 10004</UserID>
    <UserCombo>123456</UserCombo>
    <IfMustChangeCombo>>false</IfMustChangeCombo>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_USER_CHANGE_BANK_MODE_COMBINATION>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>>false</IfRetryValid>
    <Description>The user change bank mode default combination succeeded.</Description>
  </ResultRecord>
  <UserRecord>

  </UserRecord>
</RESPONSE_USER_CHANGE_BANK_MODE_COMBINATION>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field

name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran user change bank mode combination transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

Example 3 - JSON

This example sets the default bank mode user combination for user ID **Bank SHA Key 10001**.

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/change_bank_mode_combination
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/change_bank_mode_combination
```

Example Input Transaction (HTTP Body) - JSON:

```
{
  "dispatcherIDField" : null ,
  "ifMustChangeComboField" : false ,
  "userComboField" : "265742" ,
  "userIDField" : "Bank SHA Key 10001"
}
```

Example Output Transaction - JSON:

```
{
  "resultRecordField" :
  {

```

3.4.6 Web Service User Transactions - Add User Key

CenTran Programming Reference Manual

This transaction is used to add a user to the Cencon database and initialize a user key using the specified Cencon keybox.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- **IP Address** - Specifies the keybox to connect to from CenTran to read the key from.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to read the key from. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

User information required:

- **UserID** - This is the unique User ID identifying the user in the Cencon database.
- **AuthorizationRole** - This is the type of user being added. This can be one of the following values:
 - **FLM** - Indicates the user is a lock user key for use with the Cencon lock FLM mode.
 - **Route** - Indicates the user is a lock user key for use with the Cencon lock Route mode.
 - **Bank** - Indicates the user is a lock user key for use with the Cencon lock Bank mode.
- **NumberTimeWindows** - This is the number of time access windows to be defined for the user, both in the Cencon database and in the use key. You can define 0 to 3 time windows. If 0, then no time windows are defined to restrict the user access times and the user can open the lock at any time. If one or more time access windows are defined, then the user access to locks is restricted to those time access windows.
- **Window1Start / Window2Start / Window3Start** - These are the start times during the day that a time access window is starting. These are defined as intervals of 6 minutes starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 8 A.M. would be the value 80. These are optional if the time window is not being defined.
- **Window1Duration / Window2Duration / Window3Duration** - These are the duration that a time access window lasts. These are defined as intervals of 6 seconds starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 5 hours would be the value 50. These are optional if the time window is not being defined.
- **IfWindow1Sun / IfWindow1Mon / IfWindow1Tue / IfWindow1Wed / IfWindow1Thu / IfWindow1Fri / IfWindow1Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow2Sun / IfWindow2Mon / IfWindow2Tue / IfWindow2Wed / IfWindow2Thu / IfWindow2Fri / IfWindow2Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow3Sun / IfWindow3Mon / IfWindow3Tue / IfWindow3Wed / IfWindow3Thu / IfWindow3Fri / IfWindow3Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **Region** - This is the Cencon database region that the user is assigned to. If region control is set to be active in your Cencon database, then the user is restricted to being dispatched to locks with the same assigned region as the user. If region control is set to be active in your Cencon database, then you are required to assign a region to the user. If you attempt to assign a region that does not exist, then you will receive an error when trying to add the user.
- **ServiceBranch** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **CustomerID** - This is a descriptive field about the user for the assigned Customer ID. If this value is being set, it must be a Customer ID that exists in your Cencon database. It is optional.
- **FirstName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **MiddleName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **LastName** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **Nickname** - This is a descriptive field about the user for use with your business procedures as needed. It is optional.
- **NicknameExpirationDate** - This is an expiration date for the nickname for use with your business procedures as needed. It is optional.
- **MaximumNumberAllowedCombos** - This is the maximum number of allowed combinations that the user can be dispatched to them simultaneously. This applies to FLM and Route lock users. Depending on your settings with the Cencon database, you can configure how many times an FLM or Route lock user can be dispatched. This sets a further restriction on the number of simultaneous dispatches on this specific user. This field does not apply to Bank mode lock users. A value of 0 sets that no restriction is being applied.
- **EnabledStartDate** - This is the starting date that the user can be assigned to locks or dispatched. It is optional.
- **EnabledEndDate** - This is the ending date that the user can be assigned to locks or dispatched. It is optional. This value is written to the user key as well as to the Cencon database.
- **BankBranchName** - This is the bank branch name that the user is assigned to. This applies to Bank mode users only. If you are adding a Bank mode user, then you must specify a Bank Branch Name. The Bank Branch Name must be one that exists in the Cencon database, or you will receive an error when adding the user key.
- **BankUserID** - This is the Bank Branch User ID that the user is assigned to. This applies to Bank mode users only. The combination of Bank Branch Name and Bank User ID must be unique. If another Bank mode user already has the same values you are trying to use, you will receive an error when adding the user key. The Bank Branch User ID is written to the user key. It has a limited range of valid values:
 - Cencon Gen 1 locks / DS1427 Can Type Bank User Lock Keys: 01 - 32
 - Cencon Gen 2 locks / DS1963S Can Type Bank User Lock Keys: 01 - 100
- **UserCombo** - This is the default user combination that a Bank mode lock user key is assigned with. This applies to Bank mode users only. This is written to Bank mode lock user keys that are using DS1963 key model Can Types. It is not written to older DS1427 key model Can Types. This value is valid when used with a DS1963S key on a Cencon Gen 2 lock.

- **IfMustChangeCombo** - This flag specifies if a Bank mode lock user key must change their default combination at the lock before being allowed to open the lock. This is written to Bank mode lock user keys that are using DS1963 key model Can Types. It is not written to older DS1427 key model Can Types. This value is valid when used with a DS1963S key on a Cencon Gen 2 lock.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the created user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User ID already exists in the Cencon database.
- User Key is already in use in the Cencon database.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example 1 - Successful add of FLM user.

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/add_key
```

  </TRANSACTION_ADD_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_FAILED_ADD_USER_KEY_ALREADY_EXISTS</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Failed to add user key. The user key in the key reader already exists in
the database.</Description>
  </ResultRecord>
</RESPONSE_ADD_USER_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. These fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran add user key transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the IPAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example adds a new Route mode user key though a remote keybox agent persistent network connection:
KeyBoxSerialNumber:01E16499140008B

Input Transaction Format (HTTP Post) - JSON:

3.4.7 Web Service User Transactions - Edit User Key

CenTran Programming Reference Manual

This transaction updates time access data for a user key in the specified Cencon Keybox reader slot.

Note

CenTran is supporting only lock user key types for add key, edit key, and delete transactions. CenTran will not add, edit, or delete Cencon / CenTran logon key types. This is for security reasons. CenTran may be operating under a single token method of authorization (I.E. user name/password, etc). The Cencon / CenTran logon key types represent a dual token method of authorization.

Transaction information required:

- **IP Address** - Specifies the keybox to connect to from CenTran to update the key to.
- **Communications ID** - Specifies an alternate identification of a keybox to connect to from CenTran to update the key to. This is to support alternate methods of handling remote communications with keyboxes for various network topologies.
- **Communications Method** - Specifies the method of communication to be used to communicate with the key box. The default method is by TCP/IP network communications. This is specified by the value 'Tcp'.

Note

Calls to the CenTran web service, whether REST or SOAP based, determine the Dispatcher ID based on your configured method of authentication with the CenTran web service.

User information required:

- **UserID** - This is the unique User ID identifying the user in the Cencon database.
- **NumberTimeWindows** - This is the number of time access windows to be defined for the user, both in the Cencon database and in the use key. You can define 0 to 3 time windows. If 0, then no time windows are defined to restrict the user access times and the user can open the lock at any time. If one or more time access windows are defined, then the user access to locks is restricted to those time access windows.
- **Window1Start / Window2Start / Window3Start** - These are the start times during the day that a time access window is starting. These are defined as intervals of 6 seconds starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 8 A.M. would be the value 80. These are optional if the time window is not being defined.
- **Window1Duration / Window2Duration / Window3Duration** - These are the duration that a time access window lasts. These are defined as intervals of 6 seconds starting from midnight. This value can be 0 to 240 (6 minute intervals for 1440 minutes in a day). For example, 5 hours would be the value 50. These are optional if the time window is not being defined.
- **IfWindow1Sun / IfWindow1Mon / IfWindow1Tue / IfWindow1Wed / IfWindow1Thu / IfWindow1Fri / IfWindow1Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow2Sun / IfWindow2Mon / IfWindow2Tue / IfWindow2Wed / IfWindow2Thu / IfWindow2Fri / IfWindow2Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **IfWindow3Sun / IfWindow3Mon / IfWindow3Tue / IfWindow3Wed / IfWindow3Thu / IfWindow3Fri / IfWindow3Sat** - These are the flags for what days of the week that the first time window would be applied. These can be true or false. These are optional if the time window is not being defined.
- **EnabledStartDate** - This is the starting date that the user can be assigned to locks or dispatched. It is optional.
- **EnabledEndDate** - This is the ending date that the user can be assigned to locks or dispatched. It is optional. This value is written to the user key as well as to the Cencon database.

Transaction information returned:

Success:

Input transaction, followed by a result record (result, error code and description) and the updated user record..

Failure:

Input transaction, followed by a result record (result, error code and description).

Examples of Failure Conditions (for an extensive list with error codes, refer to Appendix A):

- User ID does not exist in the Cencon database.
- User Key in the Cencon keybox does not match the specified User ID.
- User Key is not present in the Cencon keybox key reader slot.
- Not authorized due to authorization role.
- Not authorized due to region (region control active).

Example 1 - Success

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/update_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/update_key
```

Input Transaction: (HTTP Body)

```
<TRANSACTION_UPDATE_USER_KEY>
  <UpdateUserKeyRecord>
    <UserID>F13</UserID>
    <NumberTimeWindows>1</NumberTimeWindows>
    <Window1Start>80</Window1Start>
    <Window1Duration>120</Window1Duration>
```

```

<IfWindow1Mon>true</IfWindow1Mon>
<IfWindow1Tue>true</IfWindow1Tue>
<IfWindow1Wed>true</IfWindow1Wed>
<IfWindow1Thu>true</IfWindow1Thu>
<IfWindow1Fri>true</IfWindow1Fri>
<EnabledStartDate>2010-04-12T00:00:00</EnabledStartDate>
<EnabledEndDate>2013-04-12T00:00:00</EnabledEndDate>
</UpdateUserKeyRecord>
<IPAddress>10.108.6.102:53003</IPAddress>
<CommunicationsID/>
<CommunicationsMethod>Tcp</CommunicationsMethod>
<DispatcherID/>
</TRANSACTION_UPDATE_USER_KEY>

```

Example Output Transaction:

```

<RESPONSE_UPDATE_USER_KEY>
  <TRANSACTION_UPDATE_USER_KEY>
    <UpdateUserKeyRecord>
      <UserID>F13</UserID>
      <NumberTimeWindows>1</NumberTimeWindows>
      <Window1Start>80</Window1Start>
      <Window1Duration>120</Window1Duration>
      <IfWindow1Mon>true</IfWindow1Mon>
      <IfWindow1Tue>true</IfWindow1Tue>
      <IfWindow1Wed>true</IfWindow1Wed>
      <IfWindow1Thu>true</IfWindow1Thu>
      <IfWindow1Fri>true</IfWindow1Fri>
      <EnabledStartDate>2010-04-12T00:00:00</EnabledStartDate>
      <EnabledEndDate>2013-04-12T00:00:00</EnabledEndDate>
    </UpdateUserKeyRecord>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_USER_KEY>
  <ResultRecord>
    <Result>Success</Result>
    <ErrorCode>RC_OK</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>The user key update succeeded.</Description>
  </ResultRecord>
  <UserRecord>
    <UserID>F13</UserID>

    <GroupName/>
    <NumberTimeWindows>1</NumberTimeWindows>
    <Window1Start>80</Window1Start>
    <Window1Duration>120</Window1Duration>
    <IfWindow1Sun>false</IfWindow1Sun>
    <IfWindow1Mon>true</IfWindow1Mon>
    <IfWindow1Tue>true</IfWindow1Tue>
    <IfWindow1Wed>true</IfWindow1Wed>
    <IfWindow1Thu>true</IfWindow1Thu>
    <IfWindow1Fri>true</IfWindow1Fri>
    <IfWindow1Sat>false</IfWindow1Sat>
    <Window2Start>0</Window2Start>
    <Window2Duration>0</Window2Duration>
    <IfWindow2Sun>false</IfWindow2Sun>
    <IfWindow2Mon>false</IfWindow2Mon>
    <IfWindow2Tue>false</IfWindow2Tue>
    <IfWindow2Wed>false</IfWindow2Wed>
    <IfWindow2Thu>false</IfWindow2Thu>
    <IfWindow2Fri>false</IfWindow2Fri>
    <IfWindow2Sat>false</IfWindow2Sat>
    <Window3Start>0</Window3Start>
    <Window3Duration>0</Window3Duration>
    <IfWindow3Sun>false</IfWindow3Sun>
    <IfWindow3Mon>false</IfWindow3Mon>
    <IfWindow3Tue>false</IfWindow3Tue>
    <IfWindow3Wed>false</IfWindow3Wed>
    <IfWindow3Thu>false</IfWindow3Thu>
    <IfWindow3Fri>false</IfWindow3Fri>
    <IfWindow3Sat>false</IfWindow3Sat>
    <Region>KENTUCKY</Region>
    <ServiceBranch>North Bank Branch 22</ServiceBranch>
    <FirstName>Janet</FirstName>
    <MiddleName>Juliet</MiddleName>
    <LastName>Justice</LastName>
    <LastUsedDate>2012-08-28T15:48:53.883Z</LastUsedDate>
    <AuthorizationRole>FLM</AuthorizationRole>
    <BankUserID>0</BankUserID>
    <TotalNumberCombosIssued>0</TotalNumberCombosIssued>
    <MaximumNumberAllowedCombos>10</MaximumNumberAllowedCombos>
    <EnabledStartDate>2010-04-12T00:00:00Z</EnabledStartDate>
    <EnabledEndDate>2013-04-12T00:00:00Z</EnabledEndDate>
    <BankBranchName/>
    <CustomerID>North Bank</CustomerID>
    <UserCombo>0</UserCombo>
  </UserRecord>
</RESPONSE_UPDATE_USER_KEY>

```

```

<IfMustChangeCombo>true</IfMustChangeCombo>
<IfLegacyImport>false</IfLegacyImport>
</UserRecord>
</RESPONSE_UPDATE_USER_KEY>

```

Example 2 - Failure

Input Transaction Format: (HTTP Post)

```
https://{host}/CentranService/rest/user/update_key
```

Example Input Transaction: (HTTP Post)

```
https://kml-3242.domain.local/CentranService/rest/user/update_key
```

Input Transaction: (HTTP Body)

```

<TRANSACTION_UPDATE_USER_KEY>
  <UpdateUserKeyRecord>
    <UserID>BU01</UserID>
    <NumberTimeWindows>0</NumberTimeWindows>
  </UpdateUserKeyRecord>
  <IPAddress>10.108.6.102:53003</IPAddress>
  <CommunicationsID/>
  <CommunicationsMethod>Tcp</CommunicationsMethod>
  <DispatcherID/>
</TRANSACTION_UPDATE_USER_KEY>

```

Output Transaction:

In this example, user BU01 does not match the key in the key reader.

```

<RESPONSE_UPDATE_USER_KEY>
  <TRANSACTION_UPDATE_USER_KEY>
    <UpdateUserKeyRecord>
      <UserID>BU01</UserID>
      <NumberTimeWindows>0</NumberTimeWindows>
    </UpdateUserKeyRecord>
    <IPAddress>10.108.6.102:53003</IPAddress>
    <CommunicationsID/>
    <CommunicationsMethod>Tcp</CommunicationsMethod>
    <DispatcherID>CentranSS</DispatcherID>
  </TRANSACTION_UPDATE_USER_KEY>
  <ResultRecord>
    <Result>Failure</Result>
    <ErrorCode>RC_ERR_UPDATE_USER_KEY_WRONG_KEY_IN_READER</ErrorCode>
    <IfRetryValid>false</IfRetryValid>
    <Description>Key in key reader does not match the user: BU01</Description>
  </ResultRecord>
</RESPONSE_UPDATE_USER_KEY>

```

JSON (Javascript Object Notation) data formatting:

JSON data formatting represents dates as the number of milliseconds in the GMT time zone, regular (non-daylight savings) time since midnight, January 1, 1970. If present, the following optional value starting with a + indicates the offset for local time conversion.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data results in some additional boolean fields being added. This fields are used to indicate if other fields are valid or not. They will all begin with the field name they indicate, and end with **Specified**.

An example of this would be the **creationDateField** field followed by **creationDateFieldSpecified** field to indicate if it is valid.

The Microsoft Windows Communication Foundation (WCF) support for serializing and deserializing JSON data also results in hexadecimal array data being sent as decimal integers. The key serial number data byte values are represented by a decimal value for each byte instead of a hexadecimal value for each byte.

JSON data formatting converts any enumerated values from the CenTran XML schema to numbers rather than passing the enumerated value name. The following enumerated values are present in the CenTran edit user key transaction:

resultField - Transaction Result Enumeration:

Value	Enumerated Value	Meaning
0	Success	The transaction completed successfully.
1	PartialSuccess	The transaction completed successfully for some of the affected items. Some affected items failed. The individual items should have result fields describing each individual result.
2	Failure	The transaction failed. The errorCodeField indicates the reason for the failure.

communicationsMethodField - Network Communications Method Enumeration:

Value	Enumerated Value	Meaning
0	Tcp	Indicates that the ipAddressField contains a valid IP address for a direct network connection to either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.

1	TcpClient	Indicates that the communicationsIDField contains a unique identifier for an existing persistent network connection from either a Centran Agent or Cencon KeyBox Agent software, to be used for communications for the command.
2	invalid	Indicates that the value is not set.

Example

This example edits the first time window for an existing Route mode user key **Route SHA Key 5** though a remote keybox agent persistent network connection: **KeyBoxSerialNumber:01E164991400008B**

Input Transaction Format (HTTP Post) - JSON:

```
https://{host}/CentranServiceJSON/rest/user/update_key
```

Example Input Transaction (HTTP Post) - JSON:

```
https://kml-3242.domain.local/CentranServiceJSON/rest/user/update_key
```

Example Input Transaction (HTTP Body) - JSON:

```
